(didn't get to the NG this one so reposting..)

Oooooh Y2K, that old hat :-)

Following on from Phantom's post, Y2K seems to only affect the clock cartridges that plug into the cartridge port. Well, the clocks have no problem with Y2K but the software for the cartridges to transfer the info to the system clock are where things fall foul.

There's a site out there where they were talking all about the different TOS versions, saying Y2K affected TOS right upto version 3 or something. Then some bright spark said it was the software for the cartridges which was the problem.

Still haven't got round to getting the language disks and XCONTROL etc. sourced yet so not tried with the system clock directly yet. Next little job :-)

http://www.atarimagazines.com/v6n1/STProductNews.html

MIND MINE ST CLOCK down the bottom.

To add also, the keyboard controller has been called a ROM here n there.
It's a PIC, well, Hitachi's version of an MCU before PIC's were common.

http://www.cpu-world.com/CPUs/630x/Hitachi-HD6301X0F62P.html

1993. Schematics for STFM and MEGA ST?

Newsgroup: comp.sys.atari.st
Date: 2005-05-30 11:04:23 UTC
From: techie_alison <techie_alison2000@yahoo.com>
Message-ID: <d7ervn$j3t$1@nwrdmz02.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 13270

Hi there :-)

Would anyone know of any weblinks of circuit schematics for the STFM AND the MEGA ST?

I'm attempting to unravel the differences between the two with regards to the battery backed clock, namely how the HD6031V1 keyboard controller / MCU is wired up.

http://www.datasheetarchive.com/datasheet/pdf/10/1053099.html
http://www.sothius.com/hypertxt/welcome.html?./additional/1040stfmaddition.html

I've started this thread relating solely to schematics so it can be found later.

Thanks,

Alison C

Le Sun, 29 May 2005 15:59:05 +0200, Ludwig Maetzke a ï¿½critï¿½:

> Meanwhile I have entered the TOS404.img into the config file but the tos
> tries to store the desktop.inf on A: (floppy).

It's because you don't have hard disk images configured, so ARAnyM, like a
real Atari, saves to floppy by default.

> Then I entered into the config for C: and D: the corresponding folders
> of the unix directory, but cannot access them from the Atari-Desktop. Is
> this caused by the betaDOS missing?

Yes, or with MiNT with the needed XFS driver.

> Where have I to enter the betaDOS in this case?

BetaDOS must be configured to use the needed BOS/DOS driver.

> And how can I setup a resolution of 800x600?

You need FVDI and the needed driver.

> And how switch off the RAM test that is done when booting?

Use a standard NVRAM Falcon configurator, like bootconf.

> And return to Linux without shutting down the Atari?

Press shift+Pause.

> I haven't found a documentation for the config file.

It seems you didn't read any documentation. All official ARAnyM packages
should come with the doc.

> Why can't I buy aranym/Linux ready for use with legal TOS404 or TOS492?

With Emutos, you can have a totally free system.

- Some advices:

Subscribe to the ARAnyM user mailing list to post your questions. Few
people in this newsgroup know about ARAnyM, and more about real Atari:
http://bobek.sh.cvut.cz/cgi-bin/mailman/listinfo/aranym-user/

Try first by using the AFROS disk image:
http://aranym.sourceforge.net/download.html

All the ARAnyM documentation is here:
http://www.sophics.cz/cgi-bin/cvsweb/aranym/doc/

Source record: 13273

Update:

Having dug out the schematics to compare between the Mega and the STF, this is getting reaaaaally lovely. The Mega has it's own seperate RTC which is completely seperate from the keyboard MCU. The Mega RTC ties into the 68000, the GLUE chip, and various address lines. I can only guess that there's code in the TOS to handle the Mega's differences directly without extra software ran on startup. OK, so that's the Mega's method out, not doing that..

I need to now look further into these mod's which power the keyboard controller. At the moment I'm guessing that it's kept powered while the ST is switched off and that the reset pin is disconnected so that the clock isn't lost at main PSU switch on. Only guesses mind.. Also wondering how long a battery would last. If drawing say 2mA, that's a 160mAh NiMd drained in 80 hours!!. If using an AA battery pack of say 1500mAh, 750 hours sounding not too bad. Assuming of course the MCU will draw only 2mA. Say 5mA then that's 500hours from AA's. 500/24 is roughly 20 days odd.

It would be really handy to talk to someone who has one of these battery backed clock mods which plays with the keyboard MCU. The main aim here is to remove the need for any seperate software and to use the hardware available.

The next stage will be to take the ST apart and build a small circuit on stripboard which plugs into the 6301MCU socket. At the moment I'm not too bothered about how big it is as I'm just trying to find out if this is indeed even possible so everything can hang out of the case until confirmed.

I'd ideally like to try to source another STFM as my development/hack machine. Am looking on eBay at the moment for a system perhaps including a SCSI HDD. The one I looked at last night went for £50 odd + £25 P+P. There must be some really rich people out there.

Aly (sorry if you're getting bored with these, but progress info all the same)

It's not just the software for the clock cartridges that have a problem.
It also affects any system doesn't have a built-in RTC, in other words
not MEGA STs/STEs, Falcons, and TTs.

>There's a site out there where they were talking all about the different TOS

Why isn't there a html Documentation at http://aranym.sourceforge.net/ ?

>> Why can't I buy aranym/Linux ready for use with legal TOS404 or TOS492?
> With Emutos, you can have a totally free system.
I don't care for a free system, only for a working and useful system.
If aranym is not sufficient for me, I will install MagicMac in the
Basilisk environment to use Atari programs on my Linux PC. The
installation of Basilisk II and MacOS 7.6 was comparatively simple with
the excellent setup program.

regards, Ludwig

Hi, Ludwig!

LM> Why isn't there a html Documentation at http://aranym.sourceforge.net/ ?

ARAnyM comes with all the documentation needed.

Ever tried "man aranym"?

There are pre-configured setups available on the site. Good point to start
from for creating your own configuration.

You might want to write a html documetation from these sources?

LM> The installation of Basilisk II and MacOS 7.6 was comparatively simple
LM> with the excellent setup program.

aranym on debian:
- apt-get install aranym
- download the AFROS, unpack it
- modify ~/.aranym/config to use it as [IDE0]
-> done!

Where is the problem?

Regards,

Alexander

I saw pictures of them on a site of their visit to Poland (a photograher happened to be wearing an Atari shirt and I guess Jack agreed to have his picture taken with the Atarian). Garry's starting to have the same receding hairline that has afflicted Jack and Sam over the years, and Sam is starting to look more like Jack every day...and of course Leonard still looks like a Sasquatch (no offense, Leonard). I think the only work Sam's involved in these days is his real estate company (Tramiel Capital). No idea on what Garry does these days (maybe he went back to Merill-Lynch), but I do know that Leonard is still involved in astronomy.

BTW, would somebody tell the G4TV retards that Tramiel is pronounced Trah-mell, not Tramm-ee-ell, as it was pronounced on G4TV's Icons? :)

Here is some info that I'll throw in for whats it's worth...

I got out my Clock Cart and manual.

Looking thru the manual there are a few support files for
the clock cart. The name of the clock cart is the Time Keeper.

ok, There is a TKAUTO.prg that is used in the AUTO folder.

It takes the time and date from the clock cart during the powerup
sequence and sets the internal clock. You can also use it
outside the Auto folder but there is a draw back to using it
this way.

Now according to the manual. This clock cartridge is removed
from the computer once the time and date are fetched.

I suppose thats one reason why there is a Pass thru port on the
cart so you can use other carts with it installed.

There is an .ACC program thats a bit interesting.

In the ACC program the time and date is displayed like this....

03:15 PM
10/28/1986

The date is the interesting part. I don't know how the date
would look after Y2K. I never tried the cart during that time.

Also, If I remember correctly This ACC would not work on a
1040 STE. I'm not sure on that. But I do remember having a
problem with one of the extra programs and I think this ACC was
it.

This Cart Clock is an old one. Made before the 1040Ste.
It did keep the correct time in the normal Xcontrol panel.
And I use the updated one on the STE.

It would be interesting to see if the ACC Date would roll over
to 2000, 2001 and etc. But I don't know what it would look like
in the Xcontrol Panel as it only supports 2 digits for the year if
I remember correctly.

Guess I need to solder the battery and see if I can get the ACC
working.

The ACC also had a alarm and a selection from 12 or 24 hour
format.

There is also a DOC on disk I need to take a look at for changes
and updates.

Hi there Dave :-)

Ah, see what you mean. And.. I would hope in the Sinclair Spectrum fashion that TOS has been rewritten to accomodate? :-) By that I mean that the Spectrum ROM's have been modified to include changes and slight streamlines to the code.

In the meantime though, what I have dug out from the loft at my parents' is the June 1988 edition of ST World which has 4 A4 pages of clock write-ups, some cartridge based, some keyboard MCU power based.

Oh ok, I think I'll keep an eye out for a Mega ST to stop this in it's tracks. With the Y2K thing and the requirement for a battery measuring 1inch x 3inches x 1inch we're about done. Well, until I start thinking about it again. ;-)

Have just recovered a bios password from my old IBM Thinkpad 755C so that's earmarked as my new potential HDD running with the ST's HDD_DMN
http://www.google.co.uk/search?hl=en&q=HDD_DMN+&btnG=Google+Search&meta=

Shall I start a new thread on HDD_DMN as I'd like to register it, have read it can pull of the clock from the PC.

Worth quite a bit actually :-) Gotta reward for you, the original review of the Time Keeper in ST World. This is the whole supplement from the June 1988 edition mentioned earlier.

<http://uk.geocities.com/techie_alison/pub/stclocks.zip>

Don't all hit it at once as it's 300K odd and geocities has a restriction on hourly traffic, so if you can't see it it'll come back the next hour. If anyone wants the 1250K originals I can email them.. Phantom, very happy to send them to you, let me know.

Aly

(reposting this..)

Worth quite a bit actually :-) Gotta reward for you, the original review of the Time Keeper in ST World. This is the whole supplement from the June 1988 edition mentioned earlier.

<http://uk.geocities.com/techie_alison/pub/stclocks.zip>

Don't all hit it at once as it's 300K odd and geocities has a restriction on hourly traffic, so if you can't see it it'll come back the next hour. If anyone wants the 1250K originals I can email them.. Phantom, very happy to send them to you, let me know.

Aly

2011. New to ST

Newsgroup: comp.sys.atari.st
Date: 2005-05-31 04:20:13 UTC
From: Docrotcod <rahbart@cox.net>
Message-ID: <0CRme.75340$yV4.41047@okepread03>
Source record: 13288

Hello all, I am new to the ST series. I grew up on 8bit Atari but never at the time could afford the ST. I have a 520ST with no floppy/hard drive (although I think I have an external floppy) I also have a Mega ST4. I have an sc1224 color monitor and a hard drive with no connector. What do you all recommend I do to learn about the ST? I have some floppies I can boot but I would really learn to use this thing to it's full advantage. I would like to find the right cable to hook up this hard disk.

Thanks

Thomas

What model of hard drive is it? Is it genuine Atari or Scsi?

Mark

Well it looks generic. A long slender case, it has an external SCSI connector (Looks like a centronics type connector). Open it up and it has a seagate hard disk. It doesn't appear to have a controller inside the case. The Seagate is a ST-1096N.

BTW it's not a ST4 but an ST2.

If anyone has an extra external floppy please let me know, it appears the 520ST doesn't have any type of floppy drive.

You need a device like the ICD link, unfortunately they are as rare as
rocking horse droppings these days. On the back of the Mega and ST you
should see an ACSI port. This was as close to SCSI the earlier machines
got. The ICD Link, is a ACSI to SCSI converter.

http://www.icd.com/atari/

It would be cheaper to source a new machine, or just use the Mega. After
the STM all ST's had a built in drive these include, the STF, STFM, STE,
Mega ST, and MegaSTE.

As far as learning about Atari, try

http://www.members.optusnet.com.au/~startreks/atari.html

Only a couple of dead links;-).

Hi all,

The sources for the system utility MyTask has been made available on
The Orphaned Projects Page. This application was originally based on
the start button SMU by Thomas Much, but Rafal Kawecki has since
extended it to also include a taskbar and a system tray.

To read more and download, please visit: http://topp.atari-users.net

Thanks to Sascha Uhlig for helping out with another great addition to
The Orphaned Projects Page.

regards,

/Joakim

The English rsc is included in the N_AES 2 package. Look in the RS0
directory. Inside that directory there are two files named:
N_AESSYS.RS0 and N_AESSYS.RS1
RS0 is the English resource.
To use the English rsc just edit n_aes.cnf. Look for the language
entry. Change it to 0 (7 is the Dutch resource)

#--- Systemkonfiguration:

language = 7

2024. USB game Pad

Newsgroup: comp.sys.atari.st
Date: 2005-05-31 20:33:55 UTC
From: David Wade <g8mqw@yahoo.com>
Message-ID: <VeadnZt0MaqpVwHfRVnyjw@eclipse.net.uk>
Source record: 13201

Folks,

I have tried many times to play ATARI games on my PC, and its just never had the right "feel" in the Joystick. Any way whilst shopping in my local TESCO I say a TRUST USB Games Pad with a big yellow reduced price sticker on. As I am a sucker for these stickers I bought it for ?4.50. What a revelation. Booted up Winston, configured at as the joystick, loaded "Buggy Boy" and its like playing on a real ST except slightly quicker. Could even map the up/down for throttle/brake to the buttons, Wonderful!!!!!!! Managed all five laps of "Off-road" second go. Can't wait to try it with Winter Olympics and Zenon II. (even LLAMATRON).

So if any of you are yearning for a "real" Atari fix you might like to check the Office Supplies section at your nearest Tesco Extra!

Dave.

PIC is the name of Microchip Technology, Inc.'s microcontroller family,
not a generic term describing any MCU. So you shouldn't call the ST
IKBD controller a PIC since it was made by Hitachi, not Microchip.

The Hitachi chip in question appears to be a clone of the Motorola 6801
with some enhancements. The 6801 was an early 8-bit microcontroller
with an instruction set similar to 6502.

There's not much to see that couldn't be found in the public domain, the PAK
and FRAK images are freely available, the graphics card is pretty boring,
the SCSI image board is also publicly available, the only unusual thing
about it is the SCSI connector on top of the drive bay.

2037. EPROM chips in ATARI

Newsgroup: comp.sys.atari.st
Date: 2005-06-01 15:20:06 UTC
From: Pawel Kaznowski <vlg@o2.pl>
Message-ID: <BEC39EC6.54AD%vlg@o2.pl>
Source record: 13214

Hello

I got some problems with STACY, I need to check if the EPROM chips are OK.

Stacy got TOS 1.0 and I can put it to the MEGA STE to try it out but it
doni¿½t work. The EPROMS are different but specs tell that its possible to use
both type if I change the JUMPERS, so should MEGA STE start-up with STACY
EPROMS - TOS 1.0.

From: The Ox That Rocks <diamikton@hotmail.com>
Message-ID: <4l9s91pd2ubsffjl8i0h4b6q4vp0vif9vq@4ax.com>
Source record: 13221

Success

I managed to use a Spyrus RD-400 Dual PCMCIA to SCSI adapter
containing two DataFab Compact Flash to PCMCIA adaptors, again
containing two dirtcheap 256 MB FLashcards from RiData.
(www.spyrus.com, www.datafab.com, www.ridata.com).

I had to buy a Link 96 Mega STe from www.wbsystemtechnik.de, Price
56,86 Euros - which includes HDDriver 7.x from Uwe Seimet. The
original Atari host adaptor will not work.

Formatting, partitioning and went perfect.
I now have a completely silent and lightning fast STe - and it is the
perfect companion for musicmaking.

Ludwig Maetzke <Ludwig.Maetzke@gmx.de> wrote:
...
>Do I need hard disk image files even if I use betaDOS? Which filesystem
>is written into these image files? DOS 8+3? VFAT?

Download the AFROS disk image from the ARAnyM website and run from that.
It contains a MiNT+XaAES setup.

There should be a couple of Megabyte free in disk image, and IIRC it's
also set up by default to access your Linux file system directly.
Then you can start thinking about other setups later if you want.

>>> And how can I setup a resolution of 800x600?
>> You need FVDI and the needed driver.
>Does FVDI fully replace NVDI 4? Or can I use NVDI instead?

While you could use NVDI by itself, that would mean terribly slow
screen updates and no 24 bit colour (since it would need to use a
normal Atari Falcon mode, which would then need to be converted to
whatever real mode you're using).

However, you can run NVDI "on top" of fVDI (run it after fVDI in the
AUTO folder and remove NVDI's normal screen drivers) to get access to all
the normal NVDI features, like vector font support (which is actually
available in the very latest fVDI (a couple of weeks now), but not yet
fully usable).

>>> I haven't found a documentation for the config file.
>> It seems you didn't read any documentation. All official ARAnyM packages
>> should come with the doc.
>Why isn't there a html Documentation at http://aranym.sourceforge.net/ ?

You'd have to ask whoever is responsible for the web page, but I suppose
it doesn't make much sense when you get it in the installation package,
anyway.

Anyway, as has already been suggested, join the ARAnyM-user mailing list.

>>> Why can't I buy aranym/Linux ready for use with legal TOS404 or TOS492?

You'd have to ask whoever owns the copyright to TOS404 and TOS492.
Since ARAnyM is GPLed, they would certainly be able to sell you an
image of TOS and send along ARAnyM.

>> With Emutos, you can have a totally free system.
>I don't care for a free system, only for a working and useful system.

Then download EmuTOS and the AFROS disk image (or even the live CD,
which will boot directly into ARAnyM).
Changing to TOS404 (if you already own a copy) later is really simple.

>If aranym is not sufficient for me, I will install MagicMac in the
>Basilisk environment to use Atari programs on my Linux PC. The
>installation of Basilisk II and MacOS 7.6 was comparatively simple with
>the excellent setup program.

Please, go ahead. If you already own MagicMac and its speed and features
cover your needs, why not use it?

I think your Stacy is TOS 1.4.

Anyhow, TOS in the STACY (1.2 or 1.4) starts at $FC0000, and TOS in the
MegaSTe (2.0x) starts at $E00000, so they are not interchangeable,
regardless of the fact that they are both contained on 2x 27001 Eproms.

Coda.

Hi,

I'm looking for the Steinberg Cubase Audio for Yamaha CBX-D5.
The only version available is the 1.1 put on Steinberg FTP server,
and I noticed that the executable program is corrupted.

So I'm looking for a person who used this program with his Atari.
I'm interested by an original disk to make it available.

Very difficult task !

Source record: 13228

```
---------------------------------------
The Nordic Atari Computer Show (NAS) 2005
---------------------------------------
```

Where? G�teborgs H�gre Samskola in Gothenburg
B�ltgatan 4 (Tram stop "Stampgatan")

```
When? 2 - 3 July 2005
Saturday, 2 July, 10:00 - 22:00
Sunday, 3 July, 11:00 - 16:00
```

```
How to get there?
By car, train or public transport.
See www.vasttrafik.se or www.gulasidorna.se (maps)
```

What? The main theme for NAS2005 is Accelerated Falcon030 with ct60/63 and
EtherNet network card.
Ethernet LAN with access to Internet is available for all who bring
their own computers.
Rodolphe Czuba will be attending NAS2005.
Nick Harlow (16/32-Systems) is probably coming.
The brothers Gild� will show the EtherNet network card.
Three Atari-compatible Hades computers will be at NAS.
A number of Atari Falcon030 with both ct60 and Falcon eXtender.
At least two Atari TT030, plus STacy and STF.
ASH-MagiC-PC will be shown with LAN/Internet capability.
64-bit multimedia console Atari Jaguar.
Atari Portfolio.

```
Entrance fee:
SEK 20 per day to the treasurer Kenneth Medin. (Press free.)
```

```
Info: Information posted at http://www.sak.nu/nas Mille Babic's homepage
is during June and July entirely devoted to NAS2005. http://mille.atari.org
```

Lodging:
We can recommend a youth hostel in Gothenburg:
Kvibergs Vandrarhem (Tram 6, 10 minutes from NAS) See
http://www.vandrarhem.com Hotel F1 is well-known for its fixed price of
SEK 310/night for a room, whether for one or three people in the same room.
Perfect for the family. Located in Fr�lunda, telephone 031-492400.
KFUK-KFUM has a summer hostel right next door to NAS, in the former
women's jail Gullbrohemmet. It is often used by backpackers and others
who want somewhere cheap to stay the night in town.

E-mail: info@sak.nu (Swedish Atari Club) atari@sverige.nu (Mille Babic, NAS05 Coordinator)

Telephone:
0762-100934 during NAS days for directions, help, etc.

Once again it is time for The Nordic Atari Show, this annual gathering that brings us together
to share experiences, talk, and let software and hardware change owners.
It is now the eleventh year in a row that NAS manifests. We really hope that all
expectations will be fulfilled and everyone can express their interest for Atari.
As was the case the previous two years, NAS is again scheduled a weekend in the
vacation month of July.
One large room will host any commercial stands, plus demonstrations by programmers
and other Atari friends. Many different models of Atari and compatibles will be shown.
The largest room will host lectures and exhibitor demonstrations of applications,
system software, games, and hardware solutions.

Other activities will include small competitions of different kinds. It has not yet
been determined which, though likely at least one classic game on an Atari will figure in some way.
Refreshments available on site will consist of soda in cans and coffee.
The event is located in a school, so everyone is expected to follow the rules of
conduct that apply to these premises.

Svenska Atariklubben
In�gogatan 12 (c/o Medin)
418 74 Gothenburg

The Milan has pdi and ISA slots, although all my pci slots are used :-)

Since there are other pci USB cards why not just persuade some nice developer
to get involved in the coding ?

Perhaps we should arrange some sort of prize ? Rather like the Hades repair
fund with suitable rules to define what is required.

How about something like this:

* uses common/cheap USB card
* works on Milan & Hades
* works with TOS/Mint/Magic
* can be shown to work with an example of each of the following
devices:
+ USB keyboard
+ USB mouse
+ USB memory stick
+ USB webcam

LOL,
man I'm sure that will be BLAZINGLY fast. If you want a useful Aranym
system, you'll have to work for it. Aranym in it's full glory is based on
MiNT, not MagiC, and there's a lot of differences to learn and things to
catch up on. You'd do well to read all the docs. Aranym is a small
team... They work on more important things like making Aranym work and
making it useful, rather than a pretty installer.

No problem, Rodolphe - I was just wanting a status report.

Many thanks! :-)

PS I was one of those who ordered the clock and rev 6 CPU at the same time.

My SIO cable is the same except it can connect to the Modem 1 port on my
Hades060 or to the modem port on a ST. I would suggest getting this version of
the SIO cable (the one you have works with APE) or just get an adapter. I have
one such adapter that I bought some months ago. Just google it and order on
the net.

>Getting the Xformer Cable is the biggest problem. They aren't a standard
>cable as you already know. I have docs and maybe some diagrams on how to
make them. I think they are on the Net as well.

Yes, they are rare and I know I have one. It is just buried in my closet along
with the rest of my Atari items. Never did use it.

I some old commercials and such on Videos that I have ordered in the past. My favorites are the ones that Alan Alda did. And then there is the famous one that ends in "Have You Played Atari Today".

I had a battery clock for my ST and it never worked right consistenly so I
took it out. I now use a program that requires me to set the date and time at
boot up. Only takes a few seconds.

The big thing is that the chain will be geared toward adults and not kids. He is suppose to have a game at every table. I just wonder which games he will choose to have.

I will be there with a new version of MyMAIL.

I will also bring lots of computer stuff with me to sell as I have too
much of that at home now.

NAS will also have its own phone exchange (PBX)

I am doing some research about PCI USB now, and will most probably
attempt something in the near future. No promises, tho. I want to get a
beta release of FreeMiNT/XaAES ready before starting such a project.

>
> Perhaps we should arrange some sort of prize ? Rather like the Hades repair
> fund with suitable rules to define what is required.

That sounds really nice ;-) However, with the rules below I dont think
I cant enter, since the implementation I want to start working on is
largely based on the Linux (or netbsd, dont know for sure yet) USB stack
implementations. And doing this for other systems than FreeMiNT is out
of the question ... I dont have time. On the positive side, if I can get
one of the above implementations to run under MiNT, we instantly have
USB drivers for most common things ;-)

Dang, you guys make me jealous. :-(

Wish I was:

A. Rich
B. Famous
C. Both

so I could attend! :-)

2079. North American Atari Show

Newsgroup: comp.sys.atari.st
Date: 2005-06-04 18:07:16 UTC
From: jdplace@REMOVESPAMcableone.net
Message-ID: <11a3rekukav4d8@corp.supernews.com>

While drooling over these posts about NAS, I began to wonder if there may be support to have a North American Atari Show? I know there are gaming expos that companies like B&C Computervisions and Best Electronics have supported. How many of you would support an Atari show in the USA? I would be willing to pay $200-300 dollars for registration if we were to fly in a guest like Rodolphe Czuba and have some interesting things to show/discuss/purchase, etc. Chime in!

No way is "Atari" developing a new games console. You saw how much
money it took for MS to create the Xbox? When did Atari get their hands
on that sort of cash?

Atari got split up years ago, I think Atari games are still going, at least when I worked on arcade machines they were still getting new machines out on the market. Its the same old story, they are just "using the name" they have no intention in Atari machines, Why would any company build a 68000 based machine these days ? it would be 10 years out of date. If they did it would be a PC based machine, doubt anyone would invest in a new OS for it, so it would never be a True Atari.

They may develop games with the Atari title, but thats as far as it will go. Though is it "*Really* Atari ? I think not, I have Unreal 2003 with Atari stamped on the box, it aint going run on a Atari machine, so whats the use in it ?! I'm affraid to say that anything with Atari stamped on it is meaningless. I've not worked on the arcade machines for a couple of years now, though the last ones I saw were Jaguar based using the 68000 series CPU. I very much doubt any company would invest in updating that kind of games machine, they would just make it PC based. Big companys don't care about us ppl who are hardcore Atari lovers, all they want is to use the Atari label and thats it. Somewhat easier than trying to make a new brand label known.

Chris

2098. Atari 2080STf

Hi All !

A few days ago I bought this machine:

http://retrospec.sgn.net/users/tomcat/2080/

Yes - its an Atari 2080STf :) Works like a charm, still has the
Gaurantie-Seal on the screw. Looks a bit yellowed (unfortunetly) but
not too harsh.
The sticker (metal) and the serial plate (see through plastic with
ATARI 2080 written mirrored on the back) both look normal Atari quality
altough the whole label is in Blue letters.
The guy that sold it to me didn't have any idea that this might be a
rarity or anything - he tought 2080's were normal Atari's back then. He
bought it from (the only one) official Atari dealer in Slovenia just
before they stopped selling ST's here.

What do you think ? Worth keeping ? ;-)

Best regards,
Tomaz

Don't know about the rarity aspect (after all, its just a 2 meg STe,
right?) but you can replace the yellowed parts from someplace like:

http://www.best-electronics-ca.com/

Have fun, STe's are great little machines! :-)

Hey Janez.

Was MK in Slovenia the only "official" distrivuter of Atari computers ?
If so - then mine is also from there :) And would explain a few things.
Did they also exchange Serial Number plates ? Does your 2080 look like
mine does (front and back plate) :

http://retrospec.sgn.net/users/tomcat/2080/

Best regards,
Tomaz

Afaik only some countries had 2080 in sale, i know that "Mladinska Knjiga"
in Slovenia did expand STF to 2mb and exchange stickers to 2080.... I also
own one.. If only MK sold thenm it may be preety rare..

My guess would be interactive, but hopefully not competitive. Nolan
has noted in several places that he considers games at their best when
people are working together and interacting.

Galen (who would like a two-player battle game of some sort that had
the two players in the same cockpit.)

I guess the remaining Atari users know very well that illegal copies
mean a lot of damage to what is left of the platform.
By the way, if you are actually an enthusiast, you should support the
platform by using legal copies.

Cross-posted to:
comp.sys.ibm.pc.games.strategic,comp.sys.amiga.emulations,alt.emulators.amiga,alt.games.abandonware,comp.sys.atari.st

What's the story with all the Deuteros disk images for sts and amigas?

A couple of years ago I downloaded Steem and Deuteros for st, and started playing, no trouble.
But when the Methanoids declare war and my research guys come up with the DFCC and drones, the materials needed for these two items are swapped(for anyone who's forgotten: the DFCC is the huge computer/storage container that holds several hundred drones).
So in my game one drone needs 490 tons of material to be built, and a DFCC only needs 6 tons(or is it 8?)!! This makes the game completely unplayable.

The first time this happened I thought, 'ok, this is someone playing a joke'.
So I downloaded a different disk image, and tried it. Same problem, so I gave
up.
Yesterday I though 'Why not give the amiga version a try?'. I downloaded WinUAE and the disk images, started playing(a bit slow and rough compared to Steem), got to the point of having war declared against me, researched drones, and of course, they're the size of a DFCC!
I couldnt believe it. I could understand if most of the st versions were like this, they may have come from the same source, but the amiga also? I am starting to wonder if I am wrong, and it was always like this, maybe a bug in the program that fixes itself later? I have no idea.

Is there someone out there who has a copy(preferably st, but amiga is ok) that does not have the problem I am describing? I would love to get hold of it. I am yet to come across a come with the atmosphere of Deuteros.

Thanks.

2113. Re: DIY Battery backed clock

Newsgroup: comp.sys.atari.st
Date: 2005-06-07 07:33:45 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <2%bpe.61489$IQ3.19409@bignews5.bellsouth.net>
Source record: 13190

Just a quick note on the subject of the TimeKeeper Clock cart and
software.

I replaced my battery. No need to solder, in just snaps in.

On my 4meg STE TOS 1.62, I can set the time and date of the clock
like this with the clock set program.

03:23PM
06/01/2005

And every time I run the clock setup, the time and date are displayed in
the
software window correctly like above.

However I have tried 2 different control panels. The very old one and
XControl v1.0
I've not tried the later ones yet.

Both Control panels will display the time correctly but both get the
year wrong.
The day and month seem fine.

Also version 1.0 of Xcontrol will give different years.

The TimeKeeper ACC software that displays the time and date are fine
except for the
year. And it varys with the 2 control panels.

I've not had time to fully test everything but it seems upon boot up the
Control Panel does have an effect on the Date.

So it looks like no only does the STe effect the clock on boot up but
also the
control panel. And maybe other software, depending on what you are
running.

I have gotten the year 2009 displayed with the TimeKeeper ACC software.
Then when I run the Clock set program, it comes back with the correct
Time and Date.

The clock cart appears to keep the correct time and date but more than
one thing is
effecting the ACC setting after bootup.

Now I have used this cart before Y2K and never had a problem like this
with
the Date.

At the moment, I am busy with other projects. When I get time to
experiment more,
I'll post the results if anyone's interested.

Also, the manual does mention something about the control panels causing
problems and to use the latest one IIRC.

However this software is old. It's Copyrighted 1986, so I assume thats
about
the time it was written. Thats way before the STe was released.

I don't have a STFM to test it on, I do have a MegaST, with TOS 1.4, I
may try it
on it and see if it will work better. Also need to test latest Xcontrol
Panel.

With a resource editor you could translate all of the RSC files from
German, which would give you an interface in your language, but any
system error messages produced by the OS would still be in German. Also
there might be a flag or two to indicate the OS's language version.

I have English resource files on my web site (DDP section) which may or
may not be of some use to you.

Atari Announces Departure of Chief Executive Officer
Tuesday June 7, 4:21 pm ET

NEW YORK, June 7 /PRNewswire-FirstCall/ -- Atari, Inc. (Nasdaq: ATAR - News), a leader in interactive entertainment, today announced that James Caparro has resigned his position as Atari's President and CEO, effective immediately. The board of directors appointed current Chairman and Chief Creative Officer, Bruno Bonnell, to act as CEO on an interim basis. The board has instituted an immediate search for a permanent President and CEO.
ADVERTISEMENT

As announced by Glenayre Technologies, Inc. in an SEC filing on June 3, 2005, Mr. Caparro entered into an agreement to become the President and Chief Executive Officer of Entertainment Distribution Corp., a division of Glenayre.

Bruno Bonnell stated, "Atari has assembled a senior management team that is moving forward to execute its strategic objectives. The team -- from product development to marketing and sales to finance -- possesses enormous energy and experience to lead us as we evolve into a more dominant force in the entertainment industry."

sounds nice, then...

Actually for all others here at comp.sys.atari.st I can
inform now that we managed to use this school wheres NAS
is hosted, to offer all of you accomodation.

You can actually sleep the night on schools floors, so
bring the stuff needed.

We (The Swe ATARI association) then hope that this will
make you all attend at NAS 2005.

Rodolphe, his wife and a friend of theirs are as we
planned welcome to stay at my home and hope that I with
help of this beautiful summer town of Gothenburg give you

all a nice unforgetable weekend.

yours,

Mille Babic

I have MagiC 6 and that came with an English manual (from Atari
Workshop), however the manual is only really new users introduction and
odens't go into great depths like the older Atari software manuals used
to in the 80's, but there is loads of info out there on the net for you
as well.

There is no demo version available, and the software is still
commercial so you can't download it legally. If you want to give it a
try without spending serious money, I suggest you look around for an
older second hand version and if you like it, pay for the current
version update.

I have a new version.What I would like is a V4 Disk 2 so I can use it with
Gemulator. Later versions don't seem to work :-(

Midway, actually.

I had the opporunity to work at Atari Games in Milpitas back in 1998,
but decided to stay with my soon-to-be-wife. (Ironically, we landed down
in this area (SF south bay / peninsula) a few years later, anyway :^))

There was a slashdot article a coupla years ago when the Midway (Atari)
offices finally closed in Milpitas. I recognized a lot of the stuff
in the photos. (Posters on the wall, etc.)

2133. Video Magazine query

Newsgroup: comp.sys.atari.st
Date: 2005-06-08 23:38:26 UTC
From: John Kavanagh <cpcoxygen@gmail.com>
Message-ID: <d87vgt$qe9$1@reader01.news.esat.net>
Source record: 13060

Hi,

I'm currently in the process of making a CD-ROM based interactive tv show. Basically here's the idea:

1. The magazine will come out monthly / bi-monthly or quarterly (depending on interest)
2. Each CD-ROM will contain well over an hour of video footage, along with text and software content. It will all be connected by a sleek interface for easy navigation.
3. The CD-ROM will cover retro news, events, interviews, latest games (for retro computers/consoles) and a lot more. Covering computers and consoles such as the Commodore 64, Sinclair Spectrum, Atari ST, Amiga, MSX and game consoles from Sega, Nintendo and others.
4. It will sell for about 5 USD (thats's about 4 Euro and about 2.70 Sterling) with free postage throughout the world.
5. Depending on the success of the CD-ROM, supporters will be paid for video footage etc, failing that they will be offered free issues of the CD-ROM.

Here is what I want to know..... WHO'S INTERESTED? As in, who would purchase such a CD-ROM, if this interests you or if you want to be involved then email us at john(at)digi-alt.net

On Mon, 6 Jun 2005 11:39:33 +0100, "exxos" <exxos@home.co.uk> wrote:

Here's the history of Atari Games Corp. I put together (and just recently updated), available at http://home.centurytel.net/hunmanik/atariholdings.html

What I just figured out is that, legally anyway, Midway Games West still exists, and is still the owner of all the Atari Games Corp. rights.

Just like Atari Interactive is the legal unit within today's Atari, Inc. that owns all the old Atari Corp. rights.

Anyway:

Atari Coin-Operated Games (Atari Games Corp.)

1985
February 6: Namco, Ltd. (of Japan) purchased the Atari Coin-Operated Games division of Atari Games, Inc. from Warner Communications, Inc. Upon the purchase, Namco renamed the division Atari Games Corp., and made Atari Games Corp. a division of Namco America, Inc. The transaction included the "Atari" name and "Fuji" logo, along with intangible property rights (patents, trademarks, and copyrights) owned by Atari Games, Inc. in conjunction with its coin-operated video game business, all for exclusive use in the area of coin-operated video games. (Upon the sale, the Atari Games, Inc. unit of Warner Communications was renamed Atari Holdings, Inc.)

Spring: Hide Nakajima became president of Atari Games.

1986
(after July 3): A group of Atari Games employees purchased Namco America's controlling interest in the company. Atari Games became independent of any corporate parent. (Both Namco America and Warner Communications remained major investors.) [NOTE- MC has not been able to document this transaction directly.] Hide Nakajima remained president of Atari Games.

1987
September 1: Atari Games purchased all assets of Barrel of Fun, Inc., owner/operator of the "Barrel of Fun" and "2001 Entertainment Center" chains of video game arcades, located primarily in six southeastern U.S. states. The acquired arcade operations would now be run by a new wholly-owned subsidiary of Atari Games, named Atari Operations, Inc.

December: Atari Games created Tengen, Inc., a wholly-owned subsidiary, for the purpose of marketing games for home video game systems (where exclusive use of the Atari brand was owned by Atari Corp.).

1990
June 26: Atari Games announced that it would repurchase the entire 43.8% share of the company held by one of its two largest shareholders, Namco America. In return, Namco received ownership of Atari Games' Atari Operations subsidiary, which operated more than 40 video game arcades in the Western and Southeastern U.S. SEE BELOW.

While there was no majority shareholder in Atari Games before the transaction, the majority shareholder after the transaction became Warner Communications, itself now a unit of Time Warner, Inc.

1992
September: Hide Nakajima was still president of Atari Games.

1993
December 31: The Warner Communications unit of Time Warner reported owning 79% of Atari Games.

1994
April 11: Time Warner Interactive Group, Atari Games and Tengen announced plans to integrate their operations and to utilize the common name, Time Warner Interactive. Use of the Atari Games brand was discontinued, though the Atari Games business unit remained distinct.

December 31: The Warner Communications unit of Time Warner reported owning 100% of Atari Games.

1996
March 29: Midway Interactive, Inc., a subsidiary of Midway Games, Inc. (itself a subsidiary of WMS Industries, Inc.) acquired the entire 100% of Atari Games owned by the Warner Communications unit of Time Warner. Atari Games became a division of Midway Games, and use of the Atari Games brand resumed.

1998
April 6: WMS Industries spun off to shareholders its entire stake of Midway Games, making Midway Games an independent entity. Atari Games remained a division of Midway Games.

1999
Atari Games released San Francisco Rush 2049. This turned out to be the last coin-operated arcade game sporting the Atari Games name and logo.

2000
January: Atari Games was renamed Midway Games West, Inc., and games produced by the group would now sport the Midway Games brand.

2001
June 22: Midway Games announced its exit from the coin-operated arcade video game market; it would now develop software exclusively for home systems. The Midway Games West division remained an in-house game development unit within Midway Games.

October 1: Happ Controls acquired assets of Midway Amusement Games' Midway and Atari Games coin-operated videogame parts and service business, and assumed warranty repair operations and all warranty obligations. See

http://www.happcontrols.com/midway/midway.htm

2003
February 7: The Midway Games West development studio was shut down, but it remained a legal entity wholly-owned by Midway Games.

TODAY: The Atari copyrights/trademarks/patents secured by Atari Games Corp. from Warner Communications in 1985, along with all Atari Games Corp. and Midway Games West properties created since 1985, are owned by the Midway Games West unit of Midway Games. Midway Games, Inc. is based in Chicago, Illinois, USA: http://www.midway.com/

Atari now is just a brand logo used by a games comapny that is themselves very small. There is no way I can see that they are going to build a new hardware, they don't have anything like the money or experience to do it. Besides it wouldn't be wise from a business point of view. I think in the future they will wind up making games mostly for the mobile market where the overheads involved in making games is less, plus they can use their old titles. People won't Q up to play PacMan on the PSP or Xbox 360, but they won't mind paying a few quid to download it to their phone.

I think there may be quite a big market for simple, retro games on the
next gen consoles. All 3 consoles are going to be more on-line
centric, with some games available for download.

If microtransactions can be made to work then the market for simple,
cheap retrogames could be huge - if they can get the cost right there
might be a lot of money to made.

My apologies to anyone who wasted their time reading my post, I am not really stupid, it just looks like it. I now know drones in fact SHOULD be 490 tons. It's been so long, I had forgotten.

To anyone who wants to play Deuteros, some advice: use the atari st emulator called Steem, use the disk images from pompey pirates or d-bug, www.the-underdogs.org has them.

Don't hesitate it truly is a great game. Don't be put off by the lack of information in the manual, that's intentional, you will truly be surprised by this game. It's big, it's difficult, it's brilliant.

Didn't I hear at one point that Infogrammes officially changed their name to Atari? So in that respect, it isn't a subsidy, but the company's official name. It's still only a surface change, though. There is no support for past Atari products at all. Just a means to use past Atari ideas and better name recognition to make PC games.

Very interesting indeed. I have been using GfaBasic with ErgoPro+Bastard
under MiNT/N.AES which is a really nice setup. But the original GfaBasic
editor simply wasn't made for Multitasking. It's a little miracle that
with ErgoPro/Bastard I could use it under MiNT. But it always felt dirty
and unsafe.

If I had more time I would use the new editor frequently. I haven't
programmed anything in GfaBasic for a long time. This could be a good
reason to try to make something nice with it again. I have still some
unfinished projects on Falcon's harddisk ...

2149. Networking Questions

Newsgroup: comp.sys.atari.st
Date: 2005-06-11 06:14:12 UTC
From: Carey Christenson <falcon060@adelphia.net>
Message-ID: <42aaab7040c900@adelphia.net>
Source record: 13087

Anyone,
First off I have my Falcon060 Networked to my Cable Modem via a Linksys
4 port Router. I am using MagicNet with the Iconnect port. I am also
using a EtherNEC for this connection to the Router. My question pertains to
another Falcon that I have that does not have a CT60. It was accellerated
and scores just as good if not better in most benchmarks than a STOCK TT030.
I want to network this Falcon to my CT60'ed Falcon. Would the LAN port work??
If so, where do I get the Cables and what software should I use?? Does MagicNET
work for this?? With this type of connection will that Falcon be able to
use the Internet at all or will I just be able to transfer files?? Also, I
have a 1040STf that I want to network to my Falcon060. Reason, I have a
MegaFile 60 that is pretty much full and I need to transfer the stuff to my
Falcon060 to burn the stuff to a CD for a backup. Will MIDI cables work for
this job?? What software will I need?? MagicNet, STING is actually all ready
setup on the 1040STf for connection through a router but I do not have an
extra EtherNEC. What about FTP software?? I use Fiffi on my Falcon060 and
plan on using that on my other Falcon but that will probably not work on a
1040STf. So what should I use for transfering these files over to my Falcon060
If there are any good networking web pages out there that will help with
these type of connections with the type of software that I have please let
me know. NOW granted, I know these type of connections will probably not
be the fastest connection possible. But it sure beats using FLOPPY's!!!

Thanks,
--
Carey Christenson

2151. Harlequin.acc

Newsgroup: comp.sys.atari.st
Date: 2005-06-11 09:11:39 UTC
From: Jens M Andreasen <ja@linux.nu>
Message-ID: <pan.2005.06.11.09.11.38.672188@linux.nu>
Source record: 13078

Hi all!

I am owner of an Atari Mega STE (currently in the attic, but otherwise in MiNT condition.)

I am considering bringing it back to life, doing what it initially was purchased for and supposed to do: MIDI sequencing.

In the old days I had an acc named "harlequin" (sp?), with calender, textedit, calc and term. It was version 2 and the calender part is now (after Y2K) partially dysfunctional.

I recall that a version 3 was released, but I never bothered to get it (kicks self in ass!)

Do anybody here know if the calender in Harlequin 3 is fully functional after Y2K? And if so; where to get it?

The 68K chip in the Atari ST is thick enough to go anywhere in our solar
system without noticing. Do not attemt to land on Europa though!

:) :)

Wasnt that a Hisoft App? If so, its probably still available for
purchase at one or more of the existing Atari dealers.

Could try Nick at 1632systems.co.uk

Coda.

Purchase? Well yes ... uhmm ... If it's really, really cheap! And if it is functional after Y2K.

I have another antique up in the attic (an Intel PII 400) that I could set up with Linux and a sequencer and a calendar. Just thought I would save that one for a giveaway to somebody in need of machine that can do realtime softsynthesis.

Hmmm ... decicions, decisions ...

>
> Could try Nick at 1632systems.co.uk

OK! I'll ask. Maybe he will agree with a one to one exchange for one of my own applications residing here:

http://mx44.linux.dk

(it's a softsynth)
(and Nick probably won't agree.)

Understand me correctly now: I am not into stealing intellectual property, just thought that it would have have been elegant to utilize a piece of outdated equipment, instead of just letting it sit, silently bored to death in the attic, along with the Tandberg all valve taperecorder and other hard-to-throw-away-items.

I was working on a universal MIDI System Exclusive dump utility with a
modern interface and a lot of bells and whistles. Color icons, resolution
independent, online help, drag&drop, and, unlike many old Atari ST MIDI
apps, multitasking friendly. Never quite finished it.

And I was dreaming of a nice GEM interface for SoX, the audio
processing/converting utility that is available for SpareMiNT.
In general, many of those nice commandline apps from the SpareMiNT archive
could use a nice GEM frontend.

> it to tell you so ...

I have made some test binaries using various variable types byte,
word, and long and tried $S|, $S&, $S%, in my tests. The byte setting
always generates a binary that is identical to the word setting. Only
thing I can conclude is $S| = $S& from my tests. I have even compared
the output in TT digger. Strange.

Anyone else want to verify my tests ? In case I have done something
wrong.
;-)

I think you would just be able to transfer files. I don;t think there is a
routing module for MagicNET
Not sure of Max Speed. You will need a "null modem" cable. I think the MAC
cable is OK.

HiSoft is alive. I approached them 2 years ago to see if they could supply
me with a set of disk-images for Lattice-C, which I bought from them
and have a perfectly valid licence number for ...

No Cigar :(

The funny thing is that a modern Gnu C Compiler for 68K will do a better
job, and once you realize how to use "strip" after compiling, the binaries
are about the same size. Now go figure?

There are some good news though :)

I bought MidiDraw from Intelligent Music, a program that turns your mouse
into some kind of, how to say, an electro-harp? I was pretty annoyed when
I realized it was incompatible with the spanking new Mega STE ... The
good news is that Intelligent Music have recently released all their
bright stuff (and even their not so bright stuff, dispite the name) into
public domain.

Programs like MidiDraw and its well working successor Diabolo do not
function as intended by the author under PC emulution. This is related to
how mouse-interrupts are handled on the ST. Basically you get one
interrupt for every pixel on the ST, wheras on a PC you get an interrupt
once in a while telling you how far the pointer have moved. Uhmm, no ...
you can't really play MIDI with mouse gestures using the way a PC prefer
doing mouse handling. And it will not help to run under Linux and
hack the mouse-driver, because the information is simply not there. It's
one of those obscure hardware thingies.

Hallo David!

DW>I think you would just be able to transfer files. I don;t think there
DW>is a routing module for MagicNET

You're wrong. There is such a module, but not in the rather outdated version available from Vassilis' homepage.

It's also possible to map drives to the other machine, but somehow limited. I was never able to use it as all of my drive letters are occupied ;-)

DW>Not sure if there is still a copy of MIDI net. I expect MIDI is
DW>hardwired at 32k Baud.

MagiCNet is also capable of working with the MIDI connection. It's not very fast, but still alomost twice as fast as the standard serial port of a ST. For transferring files, I'd setup a ftp server on one machine and transfer the files with a ftp client from the other machine. Or http server on the ST and wget on the falcon. This may run overnight, so speed is not an issue anyway.

mit freundlichem Gruï¿½ aus Ahornberg

2172. Mega STe DMA, HD floppy and other hardware issues

Newsgroup: comp.sys.atari.st
Date: 2005-06-12 04:35:23 UTC
From: Hallvard Tangeraas <inv@lid.email>
Message-ID: <42abbb88$1@news.broadpark.no>
Source record: 13098

I've finally gotten round to opening up my (early model) Mega STe
in order to find out what needs to be done and how. I've only
been able to find small bits of information here and there
(searching through "google groups" as well as the "Chips 'n'chips
X" HYPertext file and other documentation. Unfortunately it's
mostly in German which I'm not very good at (at least not
technical German), so I have some questions:

1) Adding a co-processor.
My machine has an empty PLCC type co-processor socket (UB-2,
found close to the 68000 processor) as well as an empty 20 pin
DIL socket (UB-1, found underneath the left flat-cables that
connects from the motherboard to the VME connector) which I've
figured out is for a PAL chip needed for the 68881 (and/or
68882?). Is this all that's needed?
It looks like (according to some documentation in the German
"Chips'n'Chips X" HYP file) that one or several wires may have to
be soldered between some chip pins, but I'm not sure.
I know that there isn't much software out there which supports
it, but I'm hoping that "X-alyzer" (a DX-7 editor/librarian from
C-Lab) which does some pretty processor-intensive stuff will take
advantage of it -I guess there's really no way to find out if it
will or not other than to actually try it out (C-Lab is long
gone, so there's no point in trying to ask them).

2) The ACSI host-adapter.
My SCSI drive works fine with it, but someone else with a Mega
STe wants to add a new drive and I told him there were some
specifics to the Mega STe which I can't quite remember.
I seem to recall something about having to terminate or NOT
having to terminate the drive connected to it, and only being
able to connect one SCSI device to it or something. Can someone
please fill me in?

3) DMA problems.
Some Mega STe machines had a problem with crackling audio etc. I
haven't really checked as I haven't used my machine much for
audio, but if I have a faulty chip I'd like to fix it anyway.
I had a hard time searching for the specifics on the web, but one
posting pointed me in what I hope is the right direction, as I
read the said (PLCC shaped) chip is found in location U-502 (to
the left of the memory SIMMs). Mine is marked as follows:

300588-001
(c)Atari 1988

-19
S9006

From what I read, the chip I have is one of the good, but old
GST shifter chips. Can someone confirm this, or do I need to
change it? If so, what number should I replace it with?

4) High-density floppy drive
My machine is one of the older ones which didn't come with a HD
disk drive, but I've since added one (a modified Sony MPF-520-1
which works great in DD mode), but alas the Mega STe hardware
doesn't support it out of the box. I believe I need to change a
pre-programmed PAL chip that came with newer Mega STe machines. I
am however unsure of exactly which chip I'm looking for. There's
some conflicting information going around. The said HYP manual
seems to mention UA-02 (which is found just in front of the power
supply), but a news posting mentions UA-10 which I found
underneath the power supply (you have to remove it to gain
access), close to the where the rear connectors are found. But I
think UA-02 is the right one as I've seen that reference several
places.
My UA-02 chip is a 20L8 marked as follows: C-301901-001
If I'm not mistaken, it needs to be replaced with another 20L8
marked: C-301901-002. Can anyone confirm this?

Trying to figure out the German information about this issue in
"Chips'n'chips X" it also seems like I have to solder a wire
between the mentioned PAL and the 68000 processor as follows:

UA-02 (20L8 PAL chip) U-7 (68000 processor)

Pin 32 Pin 19

Can anyone confirm this?
Also, does anyone have a pinout of the 68000 PLCC chip as it's
not that obvious where pin 1 is, and in which direction the
numbering continues.

5) DIP switch settings
There's an 8 pin DIP switch block on the front, right hand side
of the motherboard, close to the two TOS EPROMs. It's marked S-701.
According to "Chips'n'chips X", pins 1-6 are unused so it doesn't
matter how they're set, but pin 7 has to do with turning on or
off the "High density" format option in the TOS desktop
formatter. I know this from having messed around with an STe, and
it has nothing to do with actually being able to
read/write/format HD floppies, it just accesses an extra option
in TOS 2.06 (but doesn't really make sense to turn this option on
unless you actually have a fully working HD disk drive).
But I'm getting sidetracked....

I was wondering about the next switch (switch 8) which is for
turning on/off "DMA sound hardware". What on earth is this?

I believe that's about it for now. Anything else I should take a
look at now that I've opened up the Mega STe?

1) Not sure

2) Termination must be OFF and 1 drive only on a reasonably short
cable. Modifications can be made to the host adapter to allow 2 drives
though.

3) Not sure, I know mine doesnt have the problem. (If it aint broke
dont fix it?)

4&5) http://www.best-electronics-ca.com/custom-i.htm look for
"C301901".
Your WD1772 should be OK of its the 02-02 model, either that or you can
use an Ajax ($ OUCH). Some early MegaSTe's use the old WD1772 and need
this chip changing out. Also, I think that you need to be running Tos
2.06, Im not sure if 2.05 has the option to format HD disks. Leave the
dip-switch 7 ON. It doesnt matter if your hardware cant do it yet.
Don't know about the dip#8, never played with it.

Coda.

He did have one or more the last time I saw him.

And I can confirm that the calendar in Harly III works OK post 2000, though in common with all HiSoft applications the first digit of the year is displayed incorrectly, e.g. as '11/6/:5' (if you select D/M/Y - of course you have a M/D/Y option). And to ensure longer-term use: I have checked and after 2009 it becomes '11/6/;0' for 2010 :-) This only affects the fileselector, dialog boxes and the date in the Manager listing - the date is shown correctly as '11 June 2005' in its top panel (and the main dialog). I assume that your system clock is 2000-compliant, but in any case you can set any system date from 1980 up to 2079 in Harlekin's main dialog by clicking on the date and manipulating the arrows in the dialog this opens.

Regards, /Peter/

Any *English* instructions on how to do this anywhere?
Not that I have any need for an additional drive, but who knows
later on....

OK: termination OFF, and SCSI ID 0 I assume? (I guess I can check
my existing drive for that). And parity is to be turned off if
the drive has that option as well, right?

> 3) Not sure, I know mine doesnt have the problem. (If it aint broke
> dont fix it?)

Too true, or... "if it ain't broke, don't break it" which is
often the case when you mess around with electronics ;-)

> 4&5) http://www.best-electronics-ca.com/custom-i.htm look for
> "C301901".

So you can indeed confirm that it is the UA-2 chip then?
Because as I said I found the one here to be marked as above, but
with the "-001" suffix.
Do you have HD disk drive support, and do you know what that chip
is marked as inside your machine?
I believe the UA-2 chip to look for is the one with the "-002"
suffix, but it would be nice to get this confirmed before I start
looking around for it, or order it from somewhere.

> Your WD1772 should be OK of its the 02-02 model, either that or you can
> use an Ajax ($ OUCH).

I already have one. Bought it years ago when I was worried that
it would disappear from the market.

> Some early MegaSTe's use the old WD1772 and need
> this chip changing out.

There's been discussions about this throughout the years, but
"02-02" suffix or not, I'm going to stick the AJAX in there since
I bought one for that purpose (actually I bought it for my STe,
but now that I have a Mega STe the choice is easy).

> Also, I think that you need to be running Tos
> 2.06,

Yup, already installed from when I bought it.

> Im not sure if 2.05 has the option to format HD disks. Leave the
> dip-switch 7 ON. It doesnt matter if your hardware cant do it yet.
> Don't know about the dip#8, never played with it.

It was switched off, probably a factory default setting for
machines without HD disk drive support, but I've switched it on now.
However, I've found the built-in formatting option in TOS to be
crap. I'd rather use Hcopy or something which does MSDOS
correctly to begin with.

Not sure what to do about the number 8 switch. It's currently
turned off.

Source record: 13107

http://atari4ever.free.fr/hardware/drives.html - look for SCSIMSTE.ZIP

I think whatever ID you set the drive to, its still 0, but I havent tried it myself. I did try a SCSI to IDE convertor on the Stacy (same host adapter as megaste) and it worked great with a 10gb IDE drive. No parity is used, but again you *can* modify the host adapter to do parity.

I havent got the time to open my machine tonight, but if UA02 has C301901-001 or C301901-002 written on it, that thats your baby. Being a PAL it may have a sticker on it, or it may be printed I cant remember.

I do have a HD drive in my MegaSTe. I had an Ajax on standby so I installed that when I got the HD drive assembly. I was curious so I put the 02-02 back in and it still worked fine, so I left it at that. As I have a working Falcon and TT, I am keeping the Ajax in the draw as a spare.

Coda.

2183. JagFest UK 2005 Announced

Newsgroup: comp.sys.atari.st
Date: 2005-06-13 08:33:24 UTC
From: Stephen Moss <sgm23@eng.cam.ac.uk>
Message-ID: <d8jg9p$k53$1@gemini.csx.cam.ac.uk>
Source record: 13110

JagFest UK 2005

This years JagFest UK will be held on the 22nd and 23rd of October at the Medway Manor Hotel, Rochester, Kent, England.

I have been informed by Nick that The Hotel is under new management
and that while this has resulted in a small cost increase the rooms
are clean, painted and designed as function rooms and so we have
plenty of space and tables.
The cost for staying overnight is £30 (including breakfast) per person
per night, based on sharing a twin room as usual.

I am sure some of you have been awaiting this announcement for a while, life (and for some new life) along with the search for an alternate location has delayed proceedings a little but hopefully we are back on track now. For the moment there are a couple of minor changes from last year....

1)
Anyone bringing equipment must bring their own display (TV/Monitor). I know this will restrict some people from bringing equipment with them, but what's the point of doing so if there are no available displays to connect it to.

2)
As there are usually no Sunday Day visitors the tournaments for Sunday will start earlier than last year, exact timings are yet to be decided but don't be surprised to see a 9am start, although there may be scope for any early day visitors to fill any remaining slots.

Speaking of tournaments, the set-up will be the same as last year with up to two running simultaneously on both days so if anyone is considering running a tournament PM me with details at either the JagFest BBS or Atari Age.

Details of the booking arrangements and the cost of weekend passes/day tickets will be announced once the website is updated, keep an eye out for these and other announcements on the JagFest BBS at http://www.jagfest.org.uk/ and the Jaguar forum on Atari Age at www.atariage.com

OK, so for a stock, unmodified Mega STe, if for example you
install a new SCSI drive you should set it as follows:

a) SCSI termination *OFF* !!!!
b) SCSI ID 0
c) parity OFF

> I havent got the time to open my machine tonight, but if UA02 has
> C301901-001 or C301901-002 written on it, that thats your baby. Being a

Yup, here's a picture I've taken of it:
http://home.c2i.net/w-460389/PAL_floppy_Mste.jpg
It's got the "-001" suffix.

> I do have a HD drive in my MegaSTe. I had an Ajax on standby so I

Good to know.
I learnt something interesting from an electronics related
newsgroup today. It is indeed possible to copy PAL chips, unless
they're copy protected. Since spare parts for our machines are
hard to come by these days and will one day become totally
extinct, it would be an idea for someone with the proper
equipment to read the data from these chips so that new copies
can be made for other Atari users if needed.
I don't know about the copyright implications here, but since
Atari Mega STe machines are no longer produced or sold, and Atari
in its original form isn't around anymore either, surely nobody
can suffer from some enthusiasts taking steps to ensure the
survival of their machines?

2188. 68881 (or 68882) co-processor for Mega STe

Newsgroup: comp.sys.atari.st
Date: 2005-06-13 16:36:13 UTC
From: Hallvard Tangeraas <inv@lid.email>
Message-ID: <42adb5fc@news.broadpark.no>
Source record: 13116

Having opened up my Mega STe, seeing what needs upgrading or not,
I noticed the empty co-processor socket (UB-4) and the empty
co-processor GAL socket (UB-1), which has made me wonder if I
should get a 68881.

I noticed that Best electronics has the 68881
(http://www.best-electronics-ca.com/custom-i.htm) but for a
price! US$ 50 !!!!

Is this chip really that expensive, or is it because it's hard to
find these days? As fas as I know, it's a standard chip made by
Motorola, and not a custom chip for the Mega STe, so it should be
available from other sources as well, but where?

Also, I've heard mention of the 68882 in Atari related
discussions, confusing me a bit: is the 68882 just another,
faster version of the 68881, which is possibly easier to find
than the 68881, or have I misunderstood?
Should I look for a 68881 or a 68882 for my Mega STe?

Date: 2005-06-13 16:37:18 UTC
From: toothy_grin@theglaholts.net
Message-ID: <2Dire.6818$Ub4.5981@fe06.lga>
Source record: 13115

Good morrow to you all!

I am pleased to announce that I have been working on a new Atari ST STinG-based "Citadel"-type BBS. It is based on the original "Inner Sanctum"/STadel source code, but I've pretty much torn it down and completely re-worked the insides. The software will accept up to 24 Telnet concurrent connections through STinG, and will work best with an ethernet static IP connection. It will work on any model ST, but it requires 4MB RAM and at least 10 MB hard drive space.

The software is coming along smoothly: user accounts, rooms, and the message base are all working and just require some stress-testing to ensure their structures are solid. I'm currently hoping for an August 1 launch date, but a beta version of the software will be up and available sometime before then.

For more information and updated progress, hit the web site at http://www.coldwinterknights.net

Oops! My mistake.
The pin numbers are supposed to be opposite, so this would be the
correct setup:

UA-02 (20L8 PAL chip) U-7 (68000 processor)

Pin 19 Pin 32

I would still like to have all of this verified though. Anyone
reading this who's upgraded an old model Mega STe to allow for HD
disk drive support?

>than the 68881, or have I misunderstood?
>Should I look for a 68881 or a 68882 for my Mega STe?

In co-processor mode in a TT or Falcon the 68882 and 68881 are identical apart from speed, but in memory-mapped mode as in the MSTe they are not. Programs written in Pure C or Pure Pascal which try to use the fpu will hang on an MSTe with 68882 because the 68000 waits forever for a response which the 68882 is not going to send. However such programs can be patched to make them work with a 68882.

It is possible to write code which will work on both chips. Lattice C programs do.

Source record: 13122

Hi NG

My original disk containing Emagicï¿½s Logic v2.5 for Atari is broken -
and the old Conner harddisk in my STacy is broken too!

I have scorched 100ï¿½s of disks to find a security copy, but "no dice".
I have contacted Emagic (Apple) who does not support Atari platform
anylonger (No surprise!)

Can any kind regular reader of this group please pack the content of
the original program disk and send it to fedder@webhiker.dk, as i am
trying to recapture all the songs we did back in the 80ï¿½s and 90ï¿½s?

Needlees to say i have the original LOG3 key!

TIA

Meanwhile I have read the Patrice Mandin's aranym doc, but did not
understand the chapter about hard disk images completely.

> Then download EmuTOS and the AFROS disk image (or even the live CD,
> which will boot directly into ARAnyM).
Yes, I did so and now I want to replace EmuTOS with TOS404.

> Changing to TOS404 (if you already own a copy) later is really simple.
I don't get the trick with TOS 404. It does not recognize the hard disk
image file from afros.zip. Must I create an image file with aranym and
then format it? I wasn't able to format the file with Atari's utility AHDI
6 (system function "format track" doesn't work with aranym). What is to do
now? Can anyone send me an image file as *.zip with 10 .. 20 MB size that
is formatted as C: in Atari compatible way? Please help!
To be correct I do not "own" TOS 404. I have downloaded it
from the WWW page with the Atari system images that is linked to from the
aranym homepage. This doesn't appear as a betrayal to me because I don't
know anyone who sells TOS 404.

>>If aranym is not sufficient for me, I will install MagicMac in the
>>Basilisk environment to use Atari programs on my Linux PC. The
>>installation of Basilisk II and MacOS 7.6 was comparatively simple with
>>the excellent setup program.
> Please, go ahead. If you already own MagicMac and its speed and features
> cover your needs, why not use it?
I own MagicMac but gave up the idea with Basilisk because I'm not able to
print with it.

regards, Ludwig

Thanks for clearing that up.
So I should really get hold of a 68881 then.
There's a particular program I have which I'm wondering works
better with math co-processor installed. It's called "X-alyzer"
by C-Lab (later Emagic, now Apple) and is a Yamaha DX-7
synthesizer editor. I don't think the program is very widespread,
so in case nobody here knows -is there a way to test if a certain
program utilizes the co-processor?
Alternatively, I'll probably just have to take my chances and
install a 68881/accompanying PAL chip and see what happens.

Are 68881 chips hard to find? I guess I could look for a used
one, but then I'd need the exact specs. Apart from being a PLCC
shaped 68 pin chip, what else should I keep in mind?

No problem. A bit off-topic from the rest of the Emagic software
I've uploaded (I run the Notator mailing list: www.notator.org),
but since I have Notator Logic myself and had a hard time finding
the final version I've made it available to anyone else by
placing it here:

ftp://gem.win.co.nz/hall/midi/sequencer/logic/

PS. Read the text file there first. It'll tell you what you need
to download.

2199. Mega STe memory expansion (beyond 4 Mbytes)

Newsgroup: comp.sys.atari.st
Date: 2005-06-14 12:11:01 UTC
From: Hallvard Tangeraas <inv@lid.email>
Message-ID: <42aec956$1@news.broadpark.no>
Source record: 13126

Getting back to the memory expansion discussions (I can't remember which threads though)....

I really want to put in more than 4 Mbytes of RAM in my Mega STe, and I believe I read that several people in this group were involved in something like that. Egon Spengler in this group is someone I was in touch with who almost had something working as far as I know, but unfortunately I lost touch with him (has anyone else heard from him lately?).

I know most memory expansion boards plug into the 68000 processor in some way, but I'm also looking into getting hold of an IDE board of some sort (so I can use a modern, quiet laptop 2.5" drive instead of continuing to use my old and noisy 3.5" SCSI drive), so adding a memory expansion board on top of that would probably prove to be difficult.

Is using the VME bus a viable option?

Anyway I'd like to hear from others who are interested in and/or are involved in designing/building something like this. I believe I'm not the only one looking for more memory than the maximum 4 Mbytes.

Source record: 13132

Hallvard,
I recently bought a 68882 co-processor for a Falcon project that me and Mark D had going on. He took this 68882 co-processor and boosted it from its stock rating of 33 mhz to a level of 50 mhz. This is felt in benchmarks such as zBench and Kronos. The result is substantial going from the stock setting of 16 mhz to 50 mhz. yielded quite an amazing difference. I hope to have benchmarks on the web of this falcon soon. But Mark D. also did some other amazing overclocking features. He took the Videl to 40 mhz and the CPU to 20 mhz. the DSP is clocked at 50 mhz and the FPU is clocked at 50 mhz for now. I have added on to this computer my Eclipse Graphic Card and I now am able to play a 128 kbit/sec MP3 with 40 percent average CPU load. 160 kbit/sec averages around 45 percent. Well worth the money I will be paying, for this improvement. But to answer your question. The 68882 is from what I have heard 2 to 4 times faster and is exactly the same as the 68881 in every way except for processing power. I personally would opt for the 68882, it should be easier to find and mine actually cost 16 dollars shipped to my house. I bought mine from a place called Vintage Fun World. the URL is http://www.vintagefunworld.com/default.asp I sent the guy a check on Saturday and had my 68882 on Thursday. I went to his web page and seen he does not have them listed under the Amiga or Atari ST anymore but you may wish to e-mail him. Also do a search on the web. I found that e-cost.com has them for around 22 dollars for a 68882 at 33 mhz. Remember the faster the speed of the FPU if you decided to overclock the FPU the more likely you would be successful at doing this with a higher clocked FPU from the factory. Generally you can go 2 to 2.5 times faster than the rated speed of the FPU. Visit this web page for speed up mods. http://www.atari.nvg.org goto hardware then under Falcon there is a FPU accelerator. I would not do this to a Mega STe unless someone here could verify that the modification would work on a Mega Ste.

Thanks,

--

I beleive that the answer lies in the existing ST/e memory expansion projects that take a bog standard ST up to 10 or 14mb. No you will not be able to use the VME port. More likely that you will have to hand solder a SIMM socket to the CPU/Glue/DMA ICs, and add some logic of your own (or the machine will bus error if you try to address more than 4mb ram whether it exists or not)

As for the IDE drive, why not get yourself a SCSI to IDE convertor and use a quiet 3.5 IDE? I have done this in my TT, and it works perfectly.

Coda.

I think thats it, just a 68881 in a 68pin PLCC. Speed will not be important.

As far as working out if a program requires a copro - the only way I can think of other than reading the manual is to open the program with MonST and look for some FPU specific instructions, but this is probably a bit much for most people.

Coda.

OK.
For anyone else interested -the files will still be there and can
be freely downloaded any time.

Note: these are NOT pirated copies of Notator Logic. I put them
up there because you need the original Log-3 hardware dongle to
be able to use it. You'll be wasting your time if you try to run
the software without it.

START MAKING MONEY TODAY !!!!!!!!!! COOOOOOOOOOL !!!!!!!!!!
1. Make 800,000$ in 3months!! EASY!!!
Dear Friends: Greetings: I am a retired attorney. A few years ago a man came to me with a letter. He asked me to verify the fact that this was legal to do. I told him I would review it and get back to him. When I first read the letter my client brought me, I thought it was some "off-the-wall" idea to make money. A week and a half later we met in my office to discuss the issue. I told him the letter he originally brought me was not 100% legal. My client then asked me to alter it to make it perfectly legal. I asked him to make one small change in the letter. I was still curious about the letter, so he explained to me how it works. I thought it seemed like a long shot, so I decided against participating. But before my client left, I asked him to keep me updated on his results. About two months later, he called me to tell me he had received over $800,000 in cash. I didn't believe him, so he asked me to try this idea and find out for myself. I thought about it for a couple of days and decided I really didn't have anything to lose, so I asked him for a copy of the letters. I followed the instructions exactly, mailed 200 copies, and sure enough, the money started coming in! It arrived slowly at first, but coming. I kept a precise record of the earnings, and in the end, it totaled $978,493! I could hardly believe it. I met with my friend for lunch to find out exactly how it worked. He told me there are quite a few similar letters around, but this one is different because there are six names at the end of the letter, not five like some others. This fact alone results in your name being in far more returns. The other fact was the help I gave him, making sure the whole thing was legal, since no one wants to take the risk of doing something illegal.
: By now you are surely curious to know what small changes to make. If you sent a letter like this one out, in order to be completely legal, you must actually sell something in order to receive a dollar in return. So when you send a dollar to each of the names on the list, you must include these words, "PLEASE PUT ME ON YOUR MAILING LIST" and include your name and address. This is the key to the program. The item you will receive for the dollar you sent to the six people below is the letter.
: At the time I first tried this idea, I was earning a good living as a lawyer. But everyone in the legal profession will tell you there is a lot of stress that comes with the job. I told myself if things worked out, I would retired from my practice and play golf. I decided to try the letter again, but this time I sent 500 copies. Three months later , I had totaled $2,341,178!
: Here are a few reasons a person might give for not trying this program: ï¿½ Some people think they can never make a lot of money with

anything this simple. ï¿½ Some are afraid they will be ridiculed for trying ï¿½ Some dream of large sums of money, but do nothing to actually achieve it. ï¿½ Some are just plain lazy. ï¿½ Some are afraid of losing their investment. They think this program is designed to beat them out of a few dollars.
: The system works if you will just try it. But you must follow the simple instructions exactly, and in less than three months, you will receive $800,000 GUARANTEED! Keep what you are doing to yourself for awhile. Many will tell you it won`t work and will try to talk you out of your dreams. Let them know of your success after it works.
: LETTERS FROM PARTICIPANTS IN THIS PROGRAM:
: My name is David Rhodes. In 1992 my car was repossessed and bill collectors were housing my. I was laid off and my unemployment ran out. In October of 1992, I received a letter telling me how to earn $800,000 anytime I wanted. Of course, I was skeptical. But because I was so desperate and virtually had nothing to lose, I gave it a try. In January 1993, my family and I went on a 10-day cruise. The next month I bought a brand new Mercedes with cash! I am currently building a home in Virginia and I will never have to work again. This money program really works perfectly every time. I have never failed to receive less than $500,000. This is a legitimate, money-making opportunity. It does not require you to sell anything or to come in contact with people. And , best of all, you only leave the house to mail the letters. If you have always believed that someday you would get the lucky break, then simply follow the instructions and make dreams come true.
: Larry McMahon, Norfolk, VA Six months ago, I received this letter and ignored it. Five more came within a period of time and I ignored them also. I was tempted, but I was convinced that they were just a Hoax. After three weeks of deliberating, I decided to give it a try (not expecting much). Two weeks went by and nothing happened. The fourth week was unbelievable! I cant say I received $800,000 but I received $400,000. For the first time in years, I am debt free. I am doing this again, only this time starting with 500 post. I strongly recommend that you follow the instructions exactly as outlined in this letter.
: INSTRUCTIONS
1. Immediately send $1.00 to each of the six people on the list at the end of this letter. Wrap the dollar bill in a note saying " Please add me to your mailing list" and include your name and address.
: 2. Copy this letter. You do not have to type it 200 times. Simply place your cursor at the top of the page, hold it and drag it all the way down to the end of the letter. Then click on "edit" and select "copy". Now open up a notepad file on your computer and put the cursor at the top of the page in the notepad, click on 'edit' and then select 'paste' it will copy the letter for you onto your computer.
: 3. Remove the name next to the #1 on the list and move the rest of the names up one position (#2 becomes #1, #3 becomes #2, etc.....) Then place your name in the #6 position. Then save it, make sure it is saved as a txt. file.
: 4. When you have completed the instructions, take this letter and then go to (Google,Yahoo,...) and type in (Making Money Massege

board,or post massege,...)and start posting your copy to 200 message boards,or more this is only the minimum, you can post as much as you like...The more copies you send the better the results. Keep a copy of this letter so you can use it a second time. Post it out again in six months, but Post it with the addresses you receive with each dollar. It will work better the second time. NOTE: This service is 100% legal - (Refer to title 18 section 1302 of the U.S. Postal & lottery laws)
: How does it work? When you send out 200 Posts, it is estimated that at least 15 people will respond and send you a $1.00. ($15.00) Those 15 will Post 200 Posts each and 225 people send you $1.00 ($225.00) Those 225 people Post 200 Posts each and 3,375 people send you $1.00 ($3,375.00) Those 3,375 post 200 posts each and 759,375 people send you $1.00 ($759,375.00) At this point your name drops off the list, but so far you have received $813,615.00. P.S. When your money begins to come in, give the first 10% to charity with spirit and share a good fortune!
: important tip - Cover money by paper fully by which it can not been seen in light , because postal employees do some cheat some times....ok

Coda,
I am not sure on that. I would have to ask Mark D to be sure on that.
We got the Falcon modifications off from that web page I put on the
previous post. http://www.atari.nvg.org click on hardware then there are
links to a FPU, DSP, BUS/CPU accelerators as well as a screenblaster mod
they called it. All I know is that we used 2 40 mhz clocks and 2 50 mhz
clocks. According to Mark he tested my 33 mhz at 64 mhz and 66 mhz and I
believe the FPU oscillator got pretty HOT. Is this normal for this type of
MOD?? What is acceptable temperature for such an FPU and more to the point
what is acceptable temperature for the oscillator itself to run??

Thanks,

My Falcon's 68882 is a 25mhz part, and is clocked at 66mhz.

Just to clear something up, your videl is not clocked at 40mhz, but you have added a 40mhz clock to it so that it can display at higher frequencys. There is a 25 (for VGA) and a 32 (for RGB) clock as standard, and the option to add an external clock (usually through the monitor port hence screenblaster et al), but it can instead be soldered directly to the Videl. Some people cut the 32mhz RGB clock and put a 40 or 50 there, and some people just add the clock to the aforementioned external input. Which way is yours done?

Coda.

FPU instructions would suggest co-processor mode. In memory-mapped mode they appear in 68000 instructions as immediate data, so it's unlikely that a disassembler would find them. You need to check for references to the addresses of the 68881/2 registers.

Pure C checks for a memory-mapped fpu by grabbing the bus-error vector and trying to write to the fpu. If no bus error, it's there. This test doesn't distinguish between 68881 and 68882.

I shouldn't have said that the two chips are identical in co-processor mode. For instance, they dump different stuff to the stack when interrupted but this affects only people doing hairy things in assembly language.

I have a 68882 in my MSTe and haven't met any insuperable problems.
For example, C libraries compiled with Lattice for HighWire work.

2211. 4.2 Gig Baracuda Hard Drives on Falcons

Newsgroup: comp.sys.atari.st
Date: 2005-06-15 07:43:27 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <YTQre.88757$lQ3.65823@bignews5.bellsouth.net>
Source record: 13138

I just picked up a lot of Seagate Baracudda 4.2 Gig Hard Drives.

I had intended to use this on my Falcons for D2D recording and etc.

Looking at the connection on these drives, they have a 68 pin Female
connector similar to the SCSI Port on the Falcon.

Of course the Falcon has a 50 pin SCSI connector.

My Question is, Are there ready to use cables I can get to directly
connect
these drives to my Falcon?

And are there cables I can get to daisy chain at least 2 maybe 3 of
these drives
and then connect them to the Falcon.

When I bought these, I was under the impression they were 50 pin, but
actually they
are 68 pin Female. Connector looks just like the Falcon except for the
extra female
connectors.

I normal use actual 50pin scsi drives with ribbion cables to daisy
chain.

Anyone had any experience with these 68 pin SCSI drives?

If cables are not available, Is there a device to connect to the drives
to make them
50 pin compatible?

I though I'd ask here first to see if anyone has experience with these
types of drives
before going somewhere else. I got a good deal on these and would be
worth the
extra cables or etc if they will work correctly.

There is a 50-68 pin converter you can buy, it's actually not a big deal.

Thanks for the Info.

I thought there should be something available for these.

I believe these are SCSI III drives, IIRC.

I really could use a case or two already setup to handle these types of
drives. Anyone have one or more for sale?

If not, I'll check other sources...

I have 10 of these drives, not sure I can use them all.
I will be using at least 6 of em on Falcons.

Will these also work with a ICD Link 2 with an adapter?

My Mega STe could use one inside, Anyone know if it will work on the
MegaSTe with stock MegaSTE hard drive setup, If I get a adapter or does
the
MegaSTe require a different type of internal hard drive?

Also, a good source for the 50-68 pin adapter would help as I will
probably
need at least 10 of em.

2214. Reading non Atari Hard Drives on Ataris

Newsgroup: comp.sys.atari.st
Date: 2005-06-15 09:22:30 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <PkSre.89526$IQ3.5639@bignews5.bellsouth.net>
Source record: 13141

Got a question about hard drives.

If I had a hard drive that came from a Windoze machine or other computer using
a differnet OS other than Atari OS's.

Is there any way possible to read any data on the drives before partitioning them on
a Falcon?

I have various PC hardware cards such as FalconSpeed and a Vortex 386 board in
my MegaSTe. Although I know the partition limits are smaller using these.

Anyone tried to do this?

phantomm@bellsouth.net

Need a few good 68882 FPUs for a few Falcons.

I have the 16mhz ones, need 33mhz or higher.

Also, would a 68882 FPU 16mhz out of a Falcon work well in
a MegaSTE? Or should I get a faster one?

Also need a Math Co-processor for a ATonce 386SX board in my
MegaSTe. Anyone have a suitable one?

Also still in the market for broken Falcons and related hardware
and upgrades.

Also looking for external CDROM cases with/without the CDROM drive.

Also need a SpartaDos X cart and manual.

E-mail me if ya happen to have any of above for sale/trade.

It might work, but with the MegaSTE's host adapter you will not be able
to access more than 1 GByte. For more you need an ICD-compatible adapter
like the LINK96/97.

Provided that there are FAT-compatible partitions (i.e. FAT16 or FAT32,
but no NTFS) on this drive you should be able to access them using
HDDRIVER and MiNT or MagiC.

Ok, the DIY screenblaster method is done by putting a clock on the external videl input. Your 25 and 32mhz clocks should be intact - unless your bus has been accelerated (by changing the 32mhz master clock) which also affects the 32mhz RGB as its derived from the master. The 25mhz clock is seperately sourced so it isnt affected.

My 25mhz part gets reasonably warm at 66mhz, but arithmetic tests show that its working OK. I believe a popular phrase in the US is 'YMMV' :-)

If its too hot to touch, then its definately too hot!!! Other than that, run some FPU tests, and keep your finger on it, or use a suitable thermometer. If you start getting math errors then drop the speed.

If your oscillator is getting hot its probably running at too high a voltage. Did you take the +5v from an IC or one end of a capacitor? When I overclocked my DSP the first time (following instructions at atari.nvg.org), I took a metering off one end of the cap thats suggested (C121) and it was 9V! This was during investigation after the DSP stopped working (and the computer wont boot if that happens). I then found that the oscillator had died. I later took the supply from one leg of an IC and changed the osc.

Coda.

Ronald,
NO, this work was done on a C-Lab Falcon MK II that I acquired as a backup.
I am not trying to boost this computer as much like my CT60'ed Falcon. Granted
it does not score know where near what the CT60 does in alot of areas accept
for the Graphics area. BUT, with a 40 percent playing of MP3's at 128 kbit/sec
and 45 at 160 kbit/sec this computer is VERY useable now!!! Plus not to mention
I am using the Eclipse on that Falcon computer so I dont have to worry about
dealing with the CT60 and that issue at this point. WAITING for the SuperVidel.

Thanks,

I too discovered the DSP mod is clearly wrong as I sourced 9V and the DSP oscillator got very hot. However the FPU oscillator only gets hot if I use a 66MHz one, not slower ones.. Even when the oscillator is getting hot, the fpu itself is quite cool and produces accurate math. +5 is sourced from the large round capacitor near the power supply and I metered it to be sure. The master clock was changed from 32MHz to 40MHz (won't take any higher), and the videl external clock also has 40MHz going to it IIRC.. YMMV ;-)

Thanks,
Mark

Hey all,

I just fired up one of my TT's and it started to smell funny. I quickly unplugged everything and took it apart. The battery had exploded some time ago and sprayed all over. Rust was all over the back. I'm now going to soak the board in some baking soda and water to remove the acid. It looks like there will be a lot of parts replacement back by the SCSI port. The battery connector is charred badly. Anyway going to try and resurrect this thing.

If anybody has access to schematics for a TT, please contact me...

I hope to save somebody elses bacon....

Move your batteries to the outside the case if possible and keep an eye on them...

Rory

From: Phantom <phantomm@bellsouth.net>
Message-ID: <jy8se.91344$lQ3.27835@bignews5.bellsouth.net>
Source record: 13010

After looking thru my Mega STE Manual, I notice that the 2 modem ports
are wired abit different.

What was the reason, for this?

Should I stick with modem 1 or can modem 2 be used as wired?

In the future, I would like to use a Null Modem Cable on one of the
Modem
ports and use the other for Net access at the same time if possible.

Anythoughts?

One important thing to know: A major difference between EmuTOS and TOS404 is that EmuTOS has a builtin harddisk driver, TOS404 hasn't. When using TOS404 you should install a hard diskdriver. HDDRIVER is the best, try the demo version to get started.

I had the same experience with an Apple II+ computer of mine.
Actually it exploded while I was using the machine! Sounded like
a loud firecracker pop or something. Fortunately it didn't damage
anything else, or cause any shortcircuits, but the battery itself
was ripped in two.

Anyone know *why* this sort of thing happens now and then?
I believe the particular battery was a 3.6 rechargeable type.
Makes me worry about the battery inside my Mega STe -I haven't
taken a close look at it, so does anyone know if it's a
rechargeable type or something else?

Well, initially i use some water, scrubbed gently with soft toothbrush
and q-tip swab, then used 99% rubbing alcohol to the area and set it
in a window to dry. there is some damage to the SCSI port, floppy
motherboard connector and the 3 pin connector nearest the floppy is
trashed.

Vodka would've done ME some good... :)

2246. 100 mhz. Rev. 6 68060 CPU's

Newsgroup: comp.sys.atari.st
Date: 2005-06-16 16:05:08 UTC
From: Carey Christenson <falcon060@adelphia.net>
Message-ID: <42b1cd6825a2800@adelphia.net>
Source record: 13027

Everyone,
I just asked Rodolphe if I could get one more 68060 rev. 6 100 mhz CPU and
he told me that he needed 2 more for a CT63 users, one for me and one for another
person and that he only needed 6 people to be able to place an order. That
means 2 more people are needed. Anyone willing to buy just the CPU's from
Rodolphe or place any other kinds of orders should jump on the band wagon now.
Come on if you have a CT60 now you know how fast they are. Going to this new
CPU will get you about a 50 percent increase in performance. You cant get any
better performance for just a few bucks out of the atari world. So if you
want another 100 mhz CPU or are needing one for your CT60 or CT63 be sure
to get ahold of Rodolphe.

Thanks,

--

Best way imho is PLIP cable. I had Falcon connected to TT (with riebl
Ethernet card and cable modem) for years. TT acted as router and ip
masquarading, so net acces from TT to Falcon was transparent...
HTTP,FTP,NFS whatever worked great. Speed was okay as well, up to 120kb/sec
(tt<>ct2 machine) 2 problems: it takes parallel port and require MiNT,
don't know if MagicNET would work with PLIP drivers. Magic surely can't act
as router/masquarading, but FTP access would surely be possible..

Don't be mislead by the names. Use Serial 2 for preference. As with
Modem 2 it uses the much faster SCC chip, but it has more controls.

Hi Uwe,

I have a ICD Link II, will this allow up to 1 gig per partition on a
1040STe or MegaSTE? Or
is there a limit within the TOS versions? I know the Falcon can handle
upto 1gig partitions.
But I'm not to fimilar with limits on the MegaSTe TOS 2.06 and 1040STe
Tos 1.62.

Anyhow, I'd like to know the max size drive I can use inside the MegaSTe
using the stock
Atari hard drive system and what the partition limits are with the
internal harddrive.

Thanks for any help,
phantomm@bellsouth.net

Looking for a good Graphics card for a MegaSTE.
Something like a CrazyDots I or II or similar.

If you have one for sale/ trade contact me.

Overseas offers welcomed.

phantomm@bellsouth.net

2254. Re: 68881 (or 68882) co-processor for M

Newsgroup: comp.sys.atari.st

Source record: 13031

Hey Folks,

I have a few 68882 FPUs from Falcons and I had intended on placing one
in my
MegaSTE TOS 2.06, but now I'm abit confused. Some say 68882 will work
with
no problems, others say get a 68881. My 68882s are 16Mhz, Which program
or
programs should I watch for if I install the 68882?

I mostly do Graphics/Video/ and Music work and was planning on putting
all the
CAD 2.0 and support software on this machine. Anyone know of a problem
with this setup.

I'd also like to test the FPU with some software to see what happens.

I also have a Vortex 386SX board installed with the 512K FastRam option.
I need the 80387SX Co-Processor for the board if anyone has a source for
it.

A nice graphics card would be cool as well if someone has one for
sale/trade.

Where are all those Crazy Dots cards, Reflex cards and the others?

I do remember someone releasing a fix for some of the clock carts prior
to Y2K.

I have it here somewhere, just have to find it.

Not sure if it will work on the timekeeper.

It may also be on some FTP site.

I acquired a JRI Genlock for a Mega ST awhile back.

To install, you have to remove the VideoShifter and plug the Genlock in its socket.

Now, they were suppose to make versions for the STE, maybe the MegaSTE.

My question is, Does the 1040STE and MegaSTE use the same type of VideoShifter as the MegaST?

And how about the TT and Falcon? Are they the same or different.

I have a Factory 4meg MegaST to put the JRI Genlock in. But if the videoshifter is the same in a 1040STE or MegaSTE, I may try to install it
in one of those instead. Especially the MegaSTE with the extra speed and colours, if there is enough space.

The MegaSTE has a completely redesigned shifter, called the GSTshifter
iirc.
The MegaST has the same shifter as the ST/F/FM/M and all the hardware
addons are only comptible with these machines.
TT and Falcon are both different again. Sorry:-(

TOS 1.62 limits the partition size to 512 MB. You need MagiC or MiNT to
lift this restriction.

> Anyhow, I'd like to know the max size drive I can use inside the MegaSTe
> using the stock

There is no maximum size for the drive's capacity, but only a maximum
size to the partition size (depending on TOS) and the capacity of the
drive you can acutally access. The latter depends on the host adapter
and the hard disk driver. Without an ICD compatible adapter you cannot
access more than 1 GB of a drive. With an ICD compatible adapter there
is no such limit, provided you use a hard disk driver that can access
more. AHDI, in particular, cannot access more than 1 GB of a SCSI hard
disk, regardless of your hardware.

Message-ID: <f4l5b15ofdla35m8j1v4us5ckaofa8uh7v@4ax.com>
Source record: 13039

Hi Freinds

I am investegating the opportunity to upgrade the 68000 CPU on my MegaSTe - but i cannot find it! Is it not in the same (large) shape and format as in a normal ST?

As for the HD disks i purchased the ED/HD interface hardware upgrade, containing both GAL and Clock crystal from www.wbsystemtechnik.de. However i have not had success in this project - propably because the manual is in german. The upgrade is complemented with a software disc, which, unfortunately, also seems rather undocumented.

In a another thread, somebody talks abaout a magic dip-switch to make everything work? Where is this?

Can anybody explain the function(s) of the jumpers located around the motherboard?

Thanks in advance.

Anyone remember Lords of Chaos? Well do you remember a little shareware piece that preceeded it? I think it was called Sorcerer or something, but I can't seem to find any info on it...

It was all played on one screen and you got a sorcerer with a totally random selection of spells, mostly summoning some monster or another, or you could summon magic trees which spread and magic slime which spread and ate whatever it touched, or magic fire, same deal. All the sorcerers were named with some prank call name like Ben Dover. You could play with multiple players or against PC sorcerers.

I think I found it.

Name was Chaos - The Battle of Wizards. IMHO a better game than Lords
of Chaos.

And for fun here's a little java version of it I found on the web as
well...

No. It is a square 68-pin PLCC package, which is BTW clearly labeled as
MC68000 ;-)

It's a PLCC type (square shaped) IC as the one used in the STe.
You'll find it in front of the power supply. In my Mega STe it's
marked as follows, but I believe different variations of the
68000 were used:

http://home.c2i.net/w-460389/mste_68000.jpg

> As for the HD disks i purchased the ED/HD interface hardware upgrade,
> containing both GAL and Clock crystal from www.wbsystemtechnik.de.
> However i have not had success in this project - propably because the
> manual is in german. The upgrade is complemented with a software disc,
> which, unfortunately, also seems rather undocumented.

As far as I know, such an upgrade is completely unnecessary for
the Mega STe as it already has provisions for HD floppy drive
support (but not ED -who uses that anyway?), though not all Mega
STe machines have it enabled.

I have an older Mega STe which I want to use a HD floppy drive
with. The drive has been modified for use in an STe for use with
a HD/DD interface such as the one you have, but the Mega STe just
doesn't have the support for it yet.
From what I've read, if a Mega STe doesn't already have a
working HD floppy drive factory installed you have to:

1) buy a HD floppy drive of course. I'm not sure if just about
any "standard" PC type HD floppy drive will work, or if it has to
be (slightly) modified like mine if you don't use the one that
Atari put into Mega STe machine (I believe it was an Epson
something).

2) get a PAL chip marked "C301901-002" replacing the
"C301901-001" (note the suffix) which you most likely already
have. It's chip "UA-2" which you'll find right in front of the
power supply.

3) Don't quote me on this as I've (hopefully correctly)
translated this from German, using the information for the Mega
STe (old board) section of the "Chips'n Chips version X"
HYPertext file, but I believe the newer boards (*with* full HD
floppy support, delivered with HD floppy drives from the factory)

had a wire-trace between that PAL chip and the 68000 processor
which wasn't present on older boards, so a wire has to be
soldered between pin 19 of the "UA-2" PAL chip, and pin 19 of the
68000 processor ("U-7" chip). But again, don't quote me on this!
I take no responsibility of fried or malfunctioning Mega STe
boards!!!

4) Not to start that old discussion again, but *officially* you
need to change the disk controller chip (I haven't taken a note
of the chip number, but you'll find it underneath the ACSI/SCSI
interface board on the rear-right hand side of the motherboard.
Just remove the small board's screw and unplug it from the
multi-pin connector on the right hand side.

5) Officially from Atari, you need to replace the WD-1772 chip
with an "AJAX" (I can't remember the numbers on that chip, but
that's the nickname it has) which has been designed for the HD/ED
modes. The WD-1772 was built to handle just the DD mode, but
unofficially the WD1772-02-02 (not the suffix) has a higher
tolerance than other WD-1772 versions, and many people here have
reported it running fine in HD mode as well as DD mode.

6) If you want to add a "High desnity" option in addition to
"Single sided" and "Double sided" format options when choosing to
format a floppy disk from the TOS desktop, you need to flip up
the number 7 DIP switch (you'll find an 8 switch DIP block, which
is red in my machine) close to the TOS ROM/EPROMs in the
front-right hand side area of the motherboard.

> In a another thread, somebody talks abaout a magic dip-switch to make
> everything work? Where is this?

I assume you mean the DIP switch I just mentioned. It has nothing
to do with enabling or diabling HD floppy support. It just gives
you an extra format option. By flipping the switch ON you will
get that option in the format window even if you don't have a HD
floppy drive, the correct PAL chip or anything else related to HD
floppy support! Of course it won't format the floppy drive to HD
standards ;-)

> Can anybody explain the function(s) of the jumpers located around the
> motherboard?

I think a few of these are explained in the "Chips'n chips X"
HYPertext file. It's a HUGE HYP file, and you probably need a 4
Mbyte machine to run it, but I've also read it using a couple of
free Atari ST emulators in Windows ("GEMulator 2000" and "STEem
engine", the latter being the best one in my opinion).
I have the file here, so if it can't be found elsewhere I'll see
about uploading it (not sure if I have enough disk space, but
we'll see).

Hope this clears up a few things.
I would still like to get this information confirmed though.

I've considered buying games from this fellow, but I find the spelling and grammar problems in his ads to be a complete turn off. Anyone else feel this way? I guess subliminally I think the service will be bad, or something will go wrong with my order because the spelling and grammar abuse makes him appear incompetent (which probably isn't the case)... It's just not good business to present oneself in such a manner to potential customers.

Not to rush to anyone's defense, but I sent this gentleman an e-mail with some concerns I had about trying to find a certain Atari product on his website. The reply I got was polite, professional, and friendly. I was impressed. If he had the products I was looking for, I would have surely bought them on the merit of his reply to my original concern.

Lucky guy! :-)
But you still can't read/write HD floppy disks, right?

Have you checked to see what kind of floppy drive is installed
-if it is indeed a HD capable drive or not?

Also, if you have a multimeter, see if there is a connection
between the IC pins I've mentioned in my previous postings.

> I have the 16mhz ones, need 33mhz or higher.

What physical package do you need? PLCC? PGA?
Does the Falcon let you set the FPU clock independently, or
does it just run at the same speed as the CPU?

> Also need a Math Co-processor for a ATonce 386SX board
> in my MegaSTe. Anyone have a suitable one?

Possibly. How fast is the 386sx in that board?

> Also looking for external CDROM cases with/without the
> CDROM drive.

You might have a look for some Sun 411 boxes. Make sure they
come with the drive mounting bracket though.

Regarding that German text (from the "Chips'n chips version X"
HYP file) about getting HD floppy support with the Mega STe...
here's what it says (I'd appreciate it if someone understanding
German better than me could explain what it says):

---------- START ----------
Trotz HD-Laufwerk und Floppycontroller will der Rechner
nicht?

Es gibt insgesamt drei Boardlayouts vom MegaSTE, diese sind
nicht alle vom Werk aus HD-Diskettenlaufwerk-tauglich!

Hier ein Auszug aus der "Einbauanleitung fï¿½r das HD-Floppy
Upgra- de Kit" von ATARI:

AUSZUG Start
Beim MEGA STE muss noch ï¿½berprï¿½ft werden, ob eine Verbindung
von U7 (68000 CPU) Pin 32 zu UA02 (PAL20L8) Pin 19 besteht.
Falls nicht, bitte auf der Board-Unterseite einen kurzen
Draht einlï¿½ten. Ausser- dem muss das IC UA02 die Bezeichnung
C301901-002 aufgedruckt haben. Falls Sie ein IC mit der
Bezeichnung C301901-001 eingebaut haben, muss dieses
ausgetauscht werden. AUSZUG Ende

Anmerkung des Autors:
Wer zu faul ist, die Platine auszubauen, kann auch eine
Draht- brï¿½cke von Pin 19 UA02 zu Pin 10 U8 (Cache Ram)
ziehen. Kommt genau das gleiche bei raus, hat aber den
Vorteil, dass die Platine nicht ausgebaut werden muss. Den
PAL-Chip MUSS man aber zwingend ersetzen, wenn ein
C301901-001 PAL Baustein vorhanden ist!

Es ist egal, ob der Rechner einen DMA-Chip in 40 Pin
Dil-Ausfï¿½hrung oder in 44 Pin PLCC-4Ausfï¿½hrung hat, die
obengeschriebenen Massnahmen mï¿½ssen auf alle Fï¿½lle beachtet
werden! Das Pal gehï¿½rt(e) zum Lieferumfang des Original
HD-Floppy Upgrade Kit (incl TOS 2.06, AJAX Chip und EPSON
SMD340 Floppy)

Wenn die 1.44MB Floppy nicht zuverlï¿½ssig durchformatiert,
kann es am Netzteil des Computers liegen. Die Partnummer
muss mit -002 enden. Wenn es ein -001 Netzteil ist, muss die
mittlere Platinen- Schraube entfernt werden. Ausserdem muss
der Stehbolzen, in den die Schraube gedreht war, gegen die
Platine isoliert werden. Klingt zwar alles merkwï¿½rdig, ist
aber tatsï¿½chlich so. Bei der Gelegen- heit kannst du auch

gleich nachsehen, ob der "richtige" Optokopp- ler SHARP PC111 eingebaut ist. Wenn es ein CNY17 ist, kann der Bildschirm ein wenig flimmern.

2 Floppylaufwerke am internen Steckverbinder zu betreiben ist ganz einfach. Einfach das Laufwerk mit einer neu aufpressten Buchse am Floppykabel verbinden und korrekt(!) auf Driveselect B jumpern (ein- stellen) oder die Driveselect Jumper verï¿½ndern. Wird ein PC Floppykabel verwendet welches 4 um 180 Grad gedrehte Adern aufweisst mï¿½ssen beide Floppylaufwerke auf Driveselect 1 (also B) gejumpert werden, sofern die Laufwerke da mitspielen. Wenn es probleme gibt, muss das Kabel auf nichtgedrehte Buchsenbelegung durch aufsetzen einer neuen Buchse modifiziert werden!

Muss der Blitter aus irgendeinem Grund ausgebaut werden (nur dann wenn der Blitter (U205) eh gesockelt ist), mï¿½ssen hinterher die Lï¿½tlï¿½cher der Widerstï¿½nde R224 und R225 mit Drahtbrï¿½cken oder Null-Ohm Wider- stï¿½nden gebrï¿½ckt werden.

Speichermï¿½ssig ist ein MegaSTE ohne grï¿½ssere Umbauten bis auf 4 Mega- byte aufrï¿½stbar. Mehr Speicher geht nur mittels der FRAK und der PAK3 Beschleunigerkarte oder ï¿½ber die anfang Oktober 1997 erschie- nene MagnumSTE Karte fï¿½r alle MegaSTE Computer.

Hey, Don! Off topic, but I was just curious - is the Bear Cavern BBS Atari
based or something else?

Thanks.

See ya.

This connection is not onboard! Iï¿½ve made the connection. But I am unsure about the numbering system of the 68000FN12F.
On your picture I started top right and counted left outer row - then inner row. Pin 26 is then reached outer row on the bottom of your left flank (marked with "26" on my mainboard). Pin 32 is the third from the bottom on the inner left flank!

I checked out Ben's website and catalogs a couple of nights ago and I found
his website to be most difficult to read. I'm not terribly impressed with
his prices either.

Example:

SX212 1200 baud Modem $25 U.S.
SX212 1200 baud Modem $40 U.S.

At first I thought it was a double entry for the SX212 modem. I couldn't
figure out why one modem cost $15 more than the other when they are both
identical units. Then I figured it out: The $15 premium gets you a manual
and a box.

I have to say that I find Ben's shareware prices to be somewhat outrageous.
Ben wants $10 U.S. for a copy of a shareware program like BobTerm. If Ben
is actually getting people to pay $10 U.S. for a disk with one shareware
program on it, I'm going into the shareware distribution business!

Also, on the question of integrity, Ben had a contest where customers were
invited to submit "customer satisfaction" testimonials. The customer to
write and submit the best testimonial, in Ben's opinion, would receive a
cash prize of $25.

I was shocked to learn that Ben awarded the $25 cash prize to a very close
friend of his. Most reputable businesses exclude friends and family from
eligibility in contests. Not Ben! Ben even goes on to describe how much
of a friend the contest winner is.

Note to Ben Smith: Testimonials carry much more weight if they are written
by people that you don't actually have personal relations with.

Anyway, I don't anticipate that I will ever be ordering from Bravo Sierra
Computers.

Hmmm...You got me with that question. I have 4 Atari Falcons that I'd
like to
upgrade the FPUs in. One is a CT2B Falcon.

AFAIK, Stock Falcon FPUs run at the same speed of the CPU. About 16MHz
IIRC.
However, I think there is a way to run them Faster than the CPU.
But I don't know alot about what can be done to the FPUs in a stock
Falcon.

Some one setup and educate us on this subject.
I need some advice on how fast I can go and what type of FPU I need
in a stock Falcon and anyother tips and info one can share.

Andy,
Not sure if ya know anything about the Atari Falcon, here is some info.

The Centurbo II version B (CT2B) upgraded Falcon runs basically in 2
modes.
The Stock Falcon Mode and the Turbo TOS modes.

If my info is correct.This is the speed of a CT2B Falcon in Normal Mode,
compared to the CT2B Falcon in Turbo Mode.

NORMAL CT2B TURBO
------------------------ --------------------
CPU 16MHz 50MHz
BUS 16MHz 50MHz
FPU 32MHz 50MHz
DSP 32MHz 50MHz
FastRam- None 50MHz FAST RAM
VIDEL (INT) 32MHz 50MHz

The C2TB Falcon Upgrade has 2 basic modes of operation. The Turbo Modes
and the
stock standard mode. The Standard Mode suppose to run just like a normal

unmodified Falcon.
The Info in the NORMAL Column above should be the same for a Standard Stock Falcon
AFAIK. If something is not right, then someone correct me. I'm not 100% sure that a stock
Falcon FPU runs at 32Mhz as the CT2B has it's own FPU socket. So some one who
knows needs to confirm this.

Now in a normal Factory Atari Falcon there is a Socket for a optional FPU.
Some folks got the FPU when they bought the Falcon new, others installed one later
or not at all.

My upgraded Falcon with the CT2B board includes it's own FPU socket.
According to the CT2B docs I'm reading, the co-processor is 32-bit wired,
(16-bit on a basic Falcon)
According to the docs, I will need at least a 68882 33Mhz FPU to run at 50MHz.
Anything under that will not run correctly at that speed.

Now on my Fairly stock Falcons. I'm abit confused as to the type and speed I need.

I've read were folks have over clocked them and etc.
These Falcons are mostly stock, except for things like a TT Touch keyboard upgrade
and etc that shouldn't effect the speed of the machine.

I do have a Internal BlowUP Hard installed in one of them, which greatly improves
the Video Modes, It might increase the display speed slightly, but shouldn't
have any effect on the FPU AFAIK.

I'd like to run the fastest FPUs possible without problems. And if I have to change a clock or
something fairly simple, then I can do that. Also, I may be upgrading one or two of them
with modest upgrades. I have a Nemesis 25/50mhz that I might install in one.
This would allow the FPU to run faster IIRC.
So, I'd like to get the fastest ones that I can use in a stock Falcon that will run
at a higher speed if I upgrade, so I won't have to buy faster FPUs in the future if
I do install minor or major upgrades.

I could use some input on using FPUs in stock Falcons.
And also what the next highest 68882 FPU speed is over 33Mhz as I might

want to install one faster than 33mhz in my CT2B.

>
> > Also need a Math Co-processor for a ATonce 386SX board
> > in my MegaSTe. Anyone have a suitable one?
>
> Possibly. How fast is the 386sx in that board?

It is a 16MHz, 32Bit CMOS CPU. It is fitted with the optional 512KB
vortex FastRam.
I'd like to get the 80387SX Co-Processor for it. Then It would be a full
board. 8-)
It also operates with the Cache Ram of the MegaSTE.
I suppose the 80387SX Co-Processor also runs at 16mhz.

Not a bad little board actually. It can be installed in a 1040ST,
1040STE, MegaST and MegaSTE.

Would love to get it going in a Falcon. I have 2 FalconSpeed Boards that
are nice, but they only
have a 286. However, I'd bet that a 386 or maybe even a 486 would work.
But I'd have to
desolder the 286 chip and put a socket on the board. Thats a project of
mine thats been
on the back burner for some time. 8-)

Anyone out there that uses a FalconSpeed or other PC board emulator on a
Atari, I'd like
to hear from you. Send me a e-mail.

>
> > Also looking for external CDROM cases with/without the

>
> You might have a look for some Sun 411 boxes. Make sure they
> come with the drive mounting bracket though.

I've seen some of those. Actually I can make use of the early External
SCSI CDROM Drives with the Centronic ports on the back of the case.
These drives are usually old 1X or 2X speed. Doesn't matter to me
if the CDROM drive works or not.
If anyone has 1 or more of these and don't need them, send me a e-mail.

>
> - Andy Ball

Thanks for you input Andy.

Yes

> However, I think there is a way to run them Faster than the CPU.

> in a stock Falcon and anyother tips and info one can share.

General rule is you can get just under twice the speed from the chip
safely, that Motorola badge the 68882 at.

I.e

For 16mhz operation, 16mhz or higher
For 25mhz operation, 16mhz or higher
For 32mhz operation, 25mhz or higher
For 40mhz operation, 25mhz or higher
For 50mhz operation, 32mhz or higher

And so on, the chip required for the MegaSTE and Falcon is of the PLCC
variety that includes the CT2. Not sure of the TT, but fwir, the vast

majority of TT's had the co-pro from factory, and only really early
models were devoid.

The FPU clock on the Falcon/TT is asynchronys. So you can overclock the
FPU without interfering with the timing of other system components. The
CT2 is cranked pretty hard, and overclocking that, probably won't be
easy. Stock Falcon FPU is 16mhz IIRC. A stock CT2 is 50mhz FPU, so
putting a faster than 32mhz achieves nothing. The clock needs to be
replaced in order to do that.

Also fwir, all Falcon's were sold without an FPU, except for some
developer models. Some places were authorised to fit them without
voiding the warranty, and were sold in that fashion.

16mhz for stock
>
> I've read were folks have over clocked them and etc.
> These Falcons are mostly stock, except for things like a TT Touch
> keyboard upgrade

Again, the FPU clock on the Falcon/TT is asynchronys.
>
> I do have a Internal BlowUP Hard installed in one of them, which greatly

None at all.
>

That is exactly how you do it.

Also, I may be upgrading
> one or two of them
> with modest upgrades. I have a Nemesis 25/50mhz that I might install in

> This would allow the FPU to run faster IIRC.

Probably 25mhz, because unmodified the FPU runs at bus speed.

> So, I'd like to get the fastest ones that I can use in a stock Falcon

40mhz iirc, but it will make no difference to you CT2, as it is already
running at 50mhz.

2297. OVERSCAN Board for MegaST

Newsgroup: comp.sys.atari.st
Date: 2005-06-20 07:30:07 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <Vdute.38829$zm.33882@bignews4.bellsouth.net>
Source record: 12974

I have a Overscan Board for a MegaST. However I have no software or
Docs for the installation.

Anyone have the docs and or the software?

Also, what results does this board allow and will it work in anything
other
than a Mega ST?

phantomm@bellsouth.net

I have them at home, I will zip and mail for you.

Anything with a video shifter afaik. ST/F/M/FM and MegaST.

Mark

>
> This connection is not onboard!

Please verify first if my understanding is correct (my German,
especially technical-German, isn't any good, so I might have
totally misunderstood), but I *think* that it means to connect
pin 32 of the 68000 processor to pin 19 of the UA-2 "PAL" chip.

> Iï¿½ve made the connection.

Good.

> But I am
> unsure about the numbering system of the 68000FN12F.

I see. Better not turn on the computer before that's been checked
out properly.

> On your picture I started top right and counted left outer row - then
> inner row. Pin 26 is then reached outer row on the bottom of your left
> flank (marked with "26" on my mainboard). Pin 32 is the third from the
> bottom on the inner left flank!

I used the pinout from the "Chips'n chips X" HYP file. I've taken
a screenshot of it which I've uploaded here:
http://home.c2i.net/w-460389/mste_68000_pinout.gif

If I'm not completely mistaken (again, someone correct me if I'm
wrong), pin 1 is denoted by a "dent" or a "hole" in the chip
itself. It's marked with an asterisk (*) in the pinout image.

Message-ID: <mjkfb1dkv31fq576hujs2u3dtbp4lnordm@4ax.com>
Source record: 12986

Hi Hallward

Thanks to your excellent pinout of the 68000NF.
It tested the connection pin32 (U7) - pin19 (UA02) and it was already
implemented on the mainboard.
So it should work!

There are two options:
1/ Either the WD1772ph02-02 is not speci¿½ed correctly on my machine.
2/ The HD diskdrive (Teac FD235) is not working.

If it is option 1 - do you know where to get hold of an Ajax?
To test option 2, i will try with another HD drive - however it is not
easy to get hold of the Epson SMD340, which came with the original
upgrade kit.

Is there any possibility to upload the "Chips'n chips X" HYP file to
your FTP server, or is it copyrighted?. I think a lot Atarians could
benefit from this!

How is your MKS-80?

Sincerely
Peter, Denmark

Coda!

The information you are looking for is in the 'man' files (man as in
manuaul.) Alternatively in 'info'.

But I agree, having the ringbound summary on ones desk makes programming
soo much easier. Lattice is an investment I will never regret. Not least
for the durable documentation.

Good. But there were also some other things that needed checking
according to that German text. But alas, my German is pretty
lousy, so it needs to be translated first to get the full meaning.

>
> There are two options:
> 1/ Either the WD1772ph02-02 is not specï¿½ed correctly on my machine.

A third option is that there might be some jumpers that need
changing around. Does the disk drive work in DD mode, or doesn't
it work at all?

> If it is option 1 - do you know where to get hold of an Ajax?

I think it may be available from Best electronics. I just ordered
the two MegaSTe PAL chips from them today.
Here's the "Atari custom ICs" page:
http://www.best-electronics-ca.com/custom-i.htm

If they don't have it there you could try asking them. I've never
dealt with them until a few days ago. Someone else in this group
recommended me to get in touch with them when I was asking where
I could get those two PAL chips, and I've seen them mentioned
many times here, so I assume they're one of the "good guys"
unlike certain other Atari ST dealers/companies...

> To test option 2, i will try with another HD drive - however it is not
> easy to get hold of the Epson SMD340, which came with the original
> upgrade kit.

Why would you need an Epson SMD-340?
I'm certainly not going to search for a special (and probably
very expensive) floppy drive when a standard PC drive should work
fine. At least it worked fine on my STe, so I assume it'll work
fine in the Mega STe as well. I've been using it in DD mode for a
few years already, and with the slight modification I'm pretty
sure it'll work in the Mega STe in HD mode as well.

> Is there any possibility to upload the "Chips'n chips X" HYP file to
> your FTP server, or is it copyrighted?. I think a lot Atarians could

> benefit from this!

I'll see what I can do.

> How is your MKS-80?

So we've been in touch before!?
In some MIDI related newsgroup or mailing list?
Actually, the MKS-80 was a friend of mine's, and I tried to fix
it for him.
On the other hand I have an MKS-70 which is working great!

As a longtime Atari Logic/Notator user I would be hard pressed not to have been in contact with you before! (Probably in a Midi related NG). I just remember that you were well equipped on the Roland MKS range. I have MKS-7, 30, 50, 70 and 80. I bought the MKS 80 from a Norvegian guy - I guess it wasï¿½nt you!
I had problems with some of the Midi Signal diodes in them - so i shifted them all to blue ones! Cool.

Trying your link!

It's uploaded now: ftp://gem.win.co.nz/hall/info/chips_x.zip
Be aware however that it's a HUGE file at over 6 Mbytes!!

If you're interested in reading about how I modified a standard
Sony HD floppy drive for use with my STe (and now my Mega STe)
you can download that from here:
ftp://gem.win.co.nz/hall/hardware/sony_144.zip

2319. German text needs translating -anyone?

Newsgroup: comp.sys.atari.st
Date: 2005-06-21 13:01:57 UTC
From: Hallvard Tangeraas <inv@lid.email>
Message-ID: <42b80fc3$1@news.broadpark.no>
Source record: 12994

A couple of others along with myself are looking into how to upgrade the Mega STe with a HD floppy drive among other things. I found some tips and information about this issue in the German "Chips'n chips version X" Hypertext (HYP) file.
(by the way, I've just uploaded that file (which contains a wealth of hardware information for all Atari ST computers) and it can be found here: ftp://gem.win.co.nz/hall/info/chips_x.zip)

Anyway, since my German (and especially technical-German) isn't that good I could need some help in understanding what it says. I've tried a rough word-by-word translation using Altavista's online translation service, but there are still quite a few things I don't understand.
Can someone out here help?
Thanks :-)

Here's that text:

---------- START ----------
Trotz HD-Laufwerk und Floppycontroller will der Rechner nicht?

Es gibt insgesamt drei Boardlayouts vom MegaSTE, diese sind nicht alle vom Werk aus HD-Diskettenlaufwerk-tauglich!

Hier ein Auszug aus der "Einbauanleitung fï¿½r das HD-Floppy Upgra- de Kit" von ATARI:

AUSZUG Start
Beim MEGA STE muss noch ï¿½berprï¿½ft werden, ob eine Verbindung von U7 (68000 CPU) Pin 32 zu UA02 (PAL20L8) Pin 19 besteht. Falls nicht, bitte auf der Board-Unterseite einen kurzen Draht einlï¿½ten. Ausser- dem muss das IC UA02 die Bezeichnung C301901-002 aufgedruckt haben. Falls Sie ein IC mit der Bezeichnung C301901-001 eingebaut haben, muss dieses ausgetauscht werden. AUSZUG Ende

Anmerkung des Autors:
Wer zu faul ist, die Platine auszubauen, kann auch eine Draht- brï¿½cke von Pin 19 UA02 zu Pin 10 U8 (Cache Ram) ziehen. Kommt genau das gleiche bei raus, hat aber den Vorteil, dass die Platine nicht ausgebaut werden muss. Den PAL-Chip MUSS man aber zwingend ersetzen, wenn ein C301901-001 PAL Baustein vorhanden ist!

Es ist egal, ob der Rechner einen DMA-Chip in 40 Pin Dil-Ausfï¿½hrung oder in 44 Pin PLCC-4Ausfï¿½hrung hat, die

obengeschriebenen Massnahmen mi¿½ssen auf alle Fi¿½lle beachtet werden! Das Pal gehi¿½rt(e) zum Lieferumfang des Original HD-Floppy Upgrade Kit (incl TOS 2.06, AJAX Chip und EPSON SMD340 Floppy)

Wenn die 1.44MB Floppy nicht zuverli¿½ssig durchformatiert, kann es am Netzteil des Computers liegen. Die Partnummer muss mit -002 enden. Wenn es ein -001 Netzteil ist, muss die mittlere Platinen- Schraube entfernt werden. Ausserdem muss der Stehbolzen, in den die Schraube gedreht war, gegen die Platine isoliert werden. Klingt zwar alles merkwi¿½rdig, ist aber tatsi¿½chlich so. Bei der Gelegen- heit kannst du auch gleich nachsehen, ob der "richtige" Optokopp- ler SHARP PC111 eingebaut ist. Wenn es ein CNY17 ist, kann der Bildschirm ein wenig flimmern.

2 Floppylaufwerke am internen Steckverbinder zu betreiben ist ganz einfach. Einfach das Laufwerk mit einer neu aufpressten Buchse am Floppykabel verbinden und korrekt(!) auf Driveselect B jumpern (ein- stellen) oder die Driveselect Jumper veri¿½ndern. Wird ein PC Floppykabel verwendet welches 4 um 180 Grad gedrehte Adern aufweisst mi¿½ssen beide Floppylaufwerke auf Driveselect 1 (also B) gejumpert werden, sofern die Laufwerke da mitspielen. Wenn es probleme gibt, muss das Kabel auf nichtgedrehte Buchsenbelegung durch aufsetzen einer neuen Buchse modifiziert werden!

Muss der Blitter aus irgendeinem Grund ausgebaut werden (nur dann wenn der Blitter (U205) eh gesockelt ist), mi¿½ssen hinterher die Li¿½tli¿½cher der Widerstï¿½nde R224 und R225 mit Drahtbri¿½cken oder Null-Ohm Wider- sti¿½nden gebri¿½ckt werden.

Speichermi¿½ssig ist ein MegaSTE ohne gri¿½ssere Umbauten bis auf 4 Mega- byte aufri¿½stbar. Mehr Speicher geht nur mittels der FRAK und der PAK3 Beschleunigerkarte oder i¿½ber die anfang Oktober 1997 erschie- nene MagnumSTE Karte fi¿½r alle MegaSTE Computer.

From...
http://desnoyers.org/retrochallenge/

Introduction
Do you depend upon modern computers, or are you a creative spirit who can push the limits of your old hardware in order to fulfill your everyday needs? The Retrochallenge is where you find out. This competition promotes the use of vintage hardware by establishing up three challenges. You are encouraged to enter any or all of theses challenges, to judge the creative works of other participants, or simply join in the discussions on our mailing list.

What are these challenges? If you enjoy creating original artwork, music, or programs on your legacy computer, then the creative challenges are for you. Simply do what you normally do, then submit your work to be judged by your peers. The second challenge is simply using a qualifying computer through the month of July, in a competition to see can survive a month without the latest in gadgetry. The third challenges judges how well you could communicate with the outside world on a retrocomputer.

So what is the prize? The excitement of participating in the challenge (everyone gets that one), and the respect of your peers. In order to help you gain the recognition of your peers, MLAgazine has gratiously offered to publish an article about the winner.

(68000 computers get a x3 modifier compared to the standard '030 computers which will be a modifier of x1.)

You think you got what it takes? :)

DDP Translations to the rescue! :-) I've left in the original
German, but you may find it easier to read if you delete all lines
starting with the quote chevron.

-------------------- START ------------------
>Trotz HD-Laufwerk und Floppycontroller will der Rechner
>nicht?

Despite HD drive and floppy controller, the computer doesn't want
to know?

>Es gibt insgesamt drei Boardlayouts vom MegaSTE, diese sind
>nicht alle vom Werk aus HD-Diskettenlaufwerk-tauglich!

In total there are 3 board layouts of the MegaSTE, not all of
which are HD floppy drive capable ex-works.

>Hier ein Auszug aus der "Einbauanleitung f�r das HD-Floppy
>Upgra- de Kit" von ATARI:

Here an excerpt from the "Installation for the HD floppy upgrade
kit" from ATARI:

>AUSZUG Start
>Beim MEGA STE muss noch �berpr�ft werden, ob eine Verbindung
>von U7 (68000 CPU) Pin 32 zu UA02 (PAL20L8) Pin 19 besteht.
>Falls nicht, bitte auf der Board-Unterseite einen kurzen
>Draht einl�ten. Ausser- dem muss das IC UA02 die Bezeichnung
>C301901-002 aufgedruckt haben. Falls Sie ein IC mit der
>Bezeichnung C301901-001 eingebaut haben, muss dieses
>ausgetauscht werden. AUSZUG Ende

EXCERPT Start
With MEGA STE you still have to check whether a connection exists
from U7 (68000 CPU) pin 32 to UA02 (PAL20L8) pin 19. If not,
please solder in a short wire on the underside of the PCB (printed
circuit board). In addition the UA02 IC has to have the legend
C301901-002 printed on it. If you have a built-in IC with the

legend C301901-001, then this has to be substituted.
EXCERPT End

>Anmerkung des Autors:
>Wer zu faul ist, die Platine auszubauen, kann auch eine
>Draht- br&#65533;cke von Pin 19 UA02 zu Pin 10 U8 (Cache Ram)

>Vorteil, dass die Platine nicht ausgebaut werden muss. Den
>PAL-Chip MUSS man aber zwingend ersetzen, wenn ein
>C301901-001 PAL Baustein vorhanden ist!

Note by the author:
If you are too lazy to remove the PCB, you can also draw a wire bridge from pin 19 UA02 to pin 10 U8 (Cache Ram). This has exactly the same result, but has the advantage that you do not have to remove the board. However it is ESSENTIAL to replace the PAL chip if a C301901-001 PAL IC is present!

>Es ist egal, ob der Rechner einen DMA-Chip in 40 Pin
>Dil-Ausf&#65533;hrung oder in 44 Pin PLCC-4Ausf&#65533;hrung hat, die
>obengeschriebenen Massnahmen m&#65533;ssen auf alle F&#65533;lle beachtet
>werden! Das Pal geh&#65533;rt(e) zum Lieferumfang des Original
>HD-Floppy Upgrade Kit (incl TOS 2.06, AJAX Chip und EPSON
>SMD340 Floppy)

It is immaterial whether the computer has a DMA chip in 40-pin DIL format or 44-pin PLCC format, the arrangements described above must be followed in each case! The PAL belongs(ed) to the package of the original HD floppy upgrade kit (inc. TOS 2.06, AJAX chip and EPSON SMD340 Floppy).

>Wenn die 1.44MB Floppy nicht zuverl&#65533;ssig durchformatiert,
>kann es am Netzteil des Computers liegen. Die Partnummer

>gleich nachsehen, ob der "richtige" Optokopp- ler SHARP
>PC111 eingebaut ist. Wenn es ein CNY17 ist, kann der
>Bildschirm ein wenig flimmern.

If the 1.44 MB floppy does not format reliably all the way through, then this could be due to the power supply unit of the computer. The part number must end with -002. If it is a -001 power supply, then the central PCB-mounting screw [presumably of the power supply board - Translator] must be removed. In addition the pillar into which the screw fitted has to be insulated from the PCB. Although all this sounds strange, it is really the case. While you are at it, you can check whether the "correct" opto-coupler SHARP PC111 is present. If it is a CNY17, the screen may flicker a little.

>2 Floppylaufwerke am internen Steckverbinder zu betreiben
>ist ganz einfach. Einfach das Laufwerk mit einer neu

>gejumpert werden, sofern die Laufwerke da mitspielen. Wenn
>es probleme gibt, muss das Kabel auf nichtgedrehte
>Buchsenbelegung durch aufsetzen einer neuen Buchse
>modifiziert werden!

It is simple to connect two floppy drives to the internal push-on connector. Just connect the drive with a new socket pressed onto the floppy cable and set the jumper on the drive correctly (!) to drive-select B, or alter the drive-select jumpers. If a PC floppy cable is being used that has four wires rotated through 180 degrees, then both floppy drives have to be jumpered to drive-select 1 (i.e. B), provided the drives go along with that. If there are problems with this, then the cable has to be modified to a non-rotated socket connection by fitting a new socket!

>Muss der Blitter aus irgendeinem Grund ausgebaut werden (nur
>dann wenn der Blitter (U205) eh gesockelt ist), m�ssen
>hinterher die L�tl�cher der Widerst�nde R224 und R225 mit
>Drahtbr�cken oder Null-Ohm Wider- st�nden gebr�ckt werden.

If the blitter has to be removed for some reason (only if the blitter (U205) is socketed in any case), then afterwards the solder holes of the resistors R224 and R225 have to be bridged with wire straps or zero-ohm resistors.

>Speicherm�ssig ist ein MegaSTE ohne gr�ssere Umbauten bis auf
>4 Mega- byte aufr�stbar. Mehr Speicher geht nur mittels der
>FRAK und der PAK3 Beschleunigerkarte oder �ber die anfang
>Oktober 1997 erschie- nene MagnumSTE Karte f�r alle MegaSTE
>Computer.

Memory-wise a MegaSTE can be upgraded without much work up to 4 Megabytes. More memory is only possible with the FRAK and the PAK3 accelerator card or the new MagnumSTE card for all MegasSTE computers that first appeared in October 1997.

No, my entry didn't lose. I didn't have an entry because I've never done
business with Bravo Sierra Computers.

I can recognize and appreciate Ben's KISS philosophy when it comes to his
posts and website content. However, this approach makes his post and
website very difficult to read if you're not viewing the content in a
40-column browser.

If I might make a suggestion, Ben may wish to have two versions of his
website content. Perhaps if Ben created content for 40-column viewers and
for regular viewers, he wouldn't get so much flack over how his
advertisements appear.

It would probably go a long way in improving the outward appearance of his
business as well.

Call me naive, but if Ben put a little more effort into making his business
look professional, he wouldn't have to spam as much.

Just my opinion.

Hey Mark,

That would be most helpful if you could e-mail the docs and software
for the OverScan Board.

I just installed the JRI Genlock in my MegaST4. (Not tested yet)
Only took about 30 minutes. This will be nice, it has a remote control
and
lots of ports. RCA Video In and Out, RCA Audio out, Monitor ports and
etc.

I'd like to have a Good Graphics Card to see if I could get more than
16 colors out of basic displays. However there are some software
tricks to get more than 16 colours displayed at one time.

I believe the OverScan board gets rid of the white border around the
display.

It may benefit some when using the Genlock, if it doesn't already do
that.

Anyway just to make sure, my OverScan board has 2 ICs and a few Caps.
And 10 different colored wires to solder. So without the docs, I have no
clue where the wires are to be soldered. I suppose the software is
fairly small?

Only in still images, spc and spu (spectrum) can do it. FWIR there were
demo's that did 32 colours, maybe 256. But for the purposes of video
capture, I don't think so. You may have issues with the capture software
while running the Overscan cct as well.

Thanks! Much appreciated.
Here's a summary of all that. If someone finds it incorrect,
please correct me!

------------ SUMMARY START -------------------------
Despite having installed a High-density capable floppy drive and
a floppy disk controller chip, why won't it work?

There are 3 different Mega STe motherboards variations available.
Not all of them are capable of high-density floppy support
(without modifications? Not capable of supporting HD floppy
drives at all???)

You have to check if there is a connection between pin 32 of the
68000 CPU chip (U7) and pin 19 of the PAL20L8 chip (UA-02):

68000 processor (U7) PAL20L8 (UA-02)

Pin 32 Pin 19

You could use a multimeter for this.
If there's no connection you need to make one, by soldering a
wire between the two ICs, from underneath the Mega STe motherboard.
Also, if the "UA-02" position chip is marked "C301901-001" you
need to exchange it with a new chip marked "C301901-002" (note
the "-002" suffix).

Note:
If you're not bothered to remove the Mega STe motherboard from
the lower part of the plastic casing you can solder a wire
between pin 19 of the PAL20L8 chip (UA-02) and pin 10 of the
cache RAM chip (U-8). This will give the exact same result as
above, but with the advantage of not having to remove the Mega
STe motherboard.
However, it is ABSOLUTELY ESSENTIAL that you replace the PAL chip
with the "-002" suffix type if you have a "C301901-001".

If you're still having problems (e.g. high density formatting not
working reliably), the problem could be due to the Mega STe
power-supply unit. The part number should end with a "-002" suffix.

If it's got a "-001" suffix you will have to remove a certain screw
(NOTE: from here on the translation gets a bit sketchy and I
could need some more details from people who know more about the
subject than I do).

------------------- SUMMARY END ----------------------

No more CT63 available !
All are sold.
Same about CTCM

For 060 rev.6 I will check that later...

Regards

2333. ST-Falcon Cartridge PCBs

Newsgroup: comp.sys.atari.st
Date: 2005-06-23 00:48:14 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <4Dnue.46080$zm.46033@bignews4.bellsouth.net>
Source record: 12910

I have a few cartridge based projects I'd like to get into.

However, I need some fairly bare Atari ST/E- Falcon

Cartridge PCBs.

If someone has a few of these for sale/trade contact me
by e-mail.

Also, I recently got ahold of a original complete PCBoard
Designer package for the Atari ST.

Was wondering if anyone here has used this to make a
complete PCB design?

Also, it seems to only run in Mono.

Has anyone tried running it on a TT or Falcon in a 640x480 color mode?

I know some programs that will work like this as they only check the
actual resolution and not the number or colors.

Not tried this one like this yet. But it would sure help to run it in a
color resolution.

Regarding the Cartridges, E-mail me at phantomm@bellsouth.net
Overseas offers included, as it seems alot of stuff like this is hard
to get in the US now.

If the Cartridge PCBs are no longer available, I would go as far as
having some made up, if someone could point me in the right
place to get it done.

I need a source for this anyway as I have a few completed boards
that I would like to get reproduced, if it will be cost affective.

I got some 2600 PCB's from best, you could try there. I can design PCB's and have they made , or make proto-types, though with the "pro" PCB's you pay per sheet so those little boards you will end up with a lot of them.

You should instead try Scooter, which runs in up to 256 colours, and is
also GEM-compliant.

2338. DHCP and all that jazz

Newsgroup: comp.sys.atari.st
Date: 2005-06-23 11:01:55 UTC
From: dark_willow1981@lycos.com
Message-ID: <1119523494.724096.267870@g14g2000cwa.googlegroups.com>
Source record: 12915

I have just got an ethernec for my TT and want to connect it to a 512k cable broadband link (Blueyonder/Telewest), who use DHCP. I checked through the arhices here and saw this has come up efore, and that there is no DHCP supporting software for the Atari without mint so a router is the best thing to do.

Any thoughts on which one is best and affordable? Anyone else with a similar set up with Blueyonder?

Also, are there any that also have a decent firewall as the new Blueyonder cable modems don't have them built in anymore:(

There are loads of decent cable routers available, and theyre not
expensive anymore, unless you go for the latest wireless spec stuff.

Look here on ebuyer:
http://www.ebuyer.com/customer/products/index.html?action=UFNTaG93UmVzdWx0cw%3D%3D

Loads to choose from, some with hubs and wireless, some not.
If you want a reliable well known brand router with a stateful packet
inspection FW, no wireless, but 4 lan ports you could do a lot worse
than this:
http://www.ebuyer.com/customer/products/index.html?rb=8378734850&action=c2hvd19wcm9kdWN0X2
92ZXJ2aWV3&product_uid=45295

2348. Game.Machines Book - 33 years of gaming history (including Atari ST)

Newsgroup: comp.sys.atari.st
Date: 2005-06-23 20:21:38 UTC
From: John Stringer <john.stringer1@*NOSPAM*ntlworld.com>
Message-ID: <2306200521191289 71%john.stringer1@*NOSPAM*ntlworld.com>
Source record: 12925

Hi,

Some of you may be interested in a new book that has been published by a small specialist publisher. The book reviews and discusses over 200 home computers and consoles, including the Atari 8bit, 16 bit and console ranges. It manages to pull off the unusual combination of being really well designed (224 full colour pages) and informative (lots of interesting facts about the systems, key titles and market history).

Anyway you read more about the book and also have a look at some example pages at my web site:

http://www.jcec.co.uk/book.html

I'm in regular contact with the author, a really friendly ex-games journalist, if you have questions.

Cheers
John

Hello everybody,

I restarted from original Doom code, to have a cleaner base, than the
current 0.31 which was going worse than ever. I also compiled it with
a recent SDL version with many bug fixes.

Now, you have:
- Totally dynamic about resolution choice and changes, no more zoomed
320x200. You really can have Doom in 640x400 (or more). With the GEM
video driver, you can change the window size, and the game follows.

- The engine always draw in 8 bits, then SDL convert it to the screen
format. It should be faster in 8 bits mode with FastRam, because the
screen is entirely built in Fast, then c2p-ized to STRam, so less bytes
transfered from Fast to ST-Ram.

- Many memory leaks fixes with Valgrind/x86 under Linux.

For SDL, there is also support for Centscreen and Blowup resolutions, and
current Screenblaster 3 mode, I need people to test them.

> Blueyonder cable modems don't have them built in anymore:(
>

I don't think any of the cable routers firewalls are "decent".... Make sure
you don;t use the DMZ address and route only the ports you need.

Darn! A couple of days late -I just ordered the two PAL chips
from Best electronics. Oh well, perhaps someone else can benefit
from those files.

PS: the above website says "GAL" chips, but I've been told
they're "PAL" chips.

Anyway I downloaded them out of curiosity, but am a bit puzzled
as to which chips they are for. These are the files:

MODE_26.JED
MODE_HD.JED
MSTE_881.JED
MSTE_UA2.JED

I suppose "MSTE_881.JED" is the GAL needed for use with a 68881
co-processor, and should be inserted in position UB-1 (C301903-001).
And the "MSTE_UA2.JED" is probably the UA-2 chip needed for HD
floppy drive support with the "-002" suffix (C301901-002).

But I have no idea what the other two are for. There were no docs
with the file.
Can someone clear this up?

Hi all,

Ok I've put together a LCD from Didier's Eiffel page using a 4x20 LCD
(Vikay 2420STELYGBN). When I fire up the machine I get mostly
scrolling garbage with the date time etc thrown in randomly. Its not
pretty, but I guess its working somewhat. What is needed to fix/modify
so I can get this thing stop scrolling like a out of sync monitor?

Suggestions?

Flagrant System Error
Computer over.
Virus = Very Yes

I guess it depends what you are after. They don't seem to add much over and
above the security you get from NAT. If you are talking Windows boxes and
catching out-bound traffic from a PC then they don't know which app has
made the connection. What is trying to connect to port 25. Is it Outlook
Express/Eudora/Firebird which is probably OK, or some Trojan, in which case
its probably not OK.

In order to figure this out you need to run the firewall on the end device.
However even if you run a fire wall on your PC things don't get much better
because many of the firewalls prompt when they are not sure. I estimate that
> 99% of PC users don't know which applications should connect on which
port...

I also think that protective apps such as firewalls, anti-virus, and spy
guards is that the induce a false sense of security. Users click without
thinking what they are doing, because they expect to be safe, rather than
thinking "is this something I should be doing". Safe Computing is a
combination of applications + culture. Most folks don;to think...

Dave.

Hi,

the developers of this shit claim that aranym is something better than an emulator, but in fact it is worse: With EmuTOS/MinT/XaAES only about 20 per cent of the Programs that run in MagicMac are working. papyrus X of course not.
Already the name "Atari running on any machine" is a lie because it doesn't work with an Atari ROM Image as the test with TOS 404 and a disk image which another user sent to me proved. Only as a diskettes computer.
To the aranym/AFROS developers: Fuck your wives, rape your girl-friends, make children and keep your hands off things like compilers and assemblers which you have no idea of!

regards, Ludwig

Yeah I agree with the PC that if you have serious security issues then
you need to spend a LOT of dough on something like a seperate box
running Checkpoint, or you could do what I did and have a seperate
linux box running IPChains or maybe that freeware firewall, I forget
the name now. For most of us, a cheap generic router running the (and
not brilliant either) connexant firmware will do an adequate job.

In this case the user here in question wants to connect their TT/Falcon
(whoever heard of spyware or virii that make outbound network
connections? :-)) - so then in this case the firewall is superfluous.

Hmm, have to agree with most of what you say - considering you're talking
about Windoze machines. :-)

I use a Dlink hardware router here, firmware updated, with a Mandriva
Linux setup. I run Shorewall as the firewall as well. Again, given that
nothing is totally secure, still...I feel *fairly* secure with this setup.

:-)

To everyone,
Rodolphe sent out an e-mail earlier this week about anyone interested in
in a 100 mhz 68060 Rev. 6 CPU's to let him know. I forget how many he needs
to make this order possible. But lets not let him down!!! Seems to me like
6 was all that he needed, but at a price of 110 euros you cant beat it. So if
your looking for that last little bit of horsepower from your CT60 you need
one of these CPU's along with a CTCM. So get in contact with Rodolphe right
away while you still can.

Thanks,

Reason I was asking about making PCB boards is that I have a few
projects that I'd like to put on PCB boards and reproduce them if I
can find a cost effective source here in the US to reproduce them.

Anyone here had experience doing something similar here in the US
that could suggest a company or two that could re-produce a small
quanity of working boards?

BTW, these project boards range from the ST to the Falcon.
But I can't say what they do.

Although based in the UK I used a Canadian company called Myro PCB (
www.myropcb.com), they charge in US Dollars. IIRC there was a $50
setup fee for the artwork and it was $0.21 Dollars per square inch for
double sided, plated through hole PCB's with solder resist and Top
side silk screen. The price does vary with lead time, I went for the
standard two weeks although you could get it a little cheaper if you
go for a longer time.
Having said that if your PCB software does not produce Gerber files
including board outlines I don't know if they will be able to
manufacture them. My project required four boards per unit (supplied
as one artwork file (panel)), I had enough boards produced for ten
units supplied as 40 pieces in total so that they arrived as
individual milled to shape PCB's.
They even accecpt PayPal.

2398. Re Harlekin 3

Newsgroup: comp.sys.atari.st
Date: 2005-06-27 11:42:35 UTC
From: Maurice Veale <BJ@abod.co.uk>
Message-ID: <op.ss01g9jqg4fohd@81-174-207-254.pth-as15.dial.plus.net>
Source record: 12875

Hi
I bought the multi accessory Harlekin3 many years ago. I gave up on it for serious use when I couldn't get the Manager to show beyond the end of Dec 2000 without a lot of hassle.
I called Hisoft in the UK over 2 years ago and they told me they no longer sold or supported Harlekin, had parted company with the author of Harlekin and had no contact address for him. Now promted by a post & response on comp.sys.atari.st I've found the simple work around
and I can start using it after all these years - GREAT. I have it working on a TT and on Gemulator 2000.
Here's the problem & work around for anyone else who needs it. If there's a simpler one please let me know. If there is an update or patch to fix this please let me know.
In the Manager module of Harlekin3 you can show data by Day, Month, or Year. You can move forward/backward one day, month or year as you choose. Advancing by a year it is only possible to go as far as Dec 2000 and no further rendering the manager very inconvenient to use for diary date functions.
Here's the workaround: Delete Harlekins "date_f.prg" from the auto folder - I can't get it to work after 2000. When Harlekin is up and running - in the main Harlekin window click on the calendar icon or date line in the top bar. Set the date to todays date (any date)- click OK.Open the Manager module or click on the open Manager window (don't close the main Harlekin window before doing this). The top bar of Manager should now update to show the system date you just entered but the Diary function may show some previous date. Single click on the calendar icon in the second bar at top of the Manager module. The diary function should also now update. You can now advance through that year by day or month.
To advance to any year after 2000 repeat the above procedure. Going backwards is easier use one month at a time or the above procedure. It is very much faster to do it than it is to describe it in words.
Strangely you can advance one day at a time from 1999 to any date after 2000 so the code must be there in the program.
16/32 Systems still have Harlekin3 for sale - its a bargain at the asking price.

regards
Maurice

2399. aranym problem solved

Hi,

after I flamed so heavily against aranym/afros, friendly Francois le Coat sent me an email with a link where to download a hard disk image for aranym/TOS 404 prepared with the HD Driver Demo. With this I was able to run aranym with TOS 404 that detected the C: image.
I am sorry for having stated things about aranym that are wrong. I was so angry because if I don't get a usable Atari-Emulation on Linux I must buy MS Windows and one of the proved Atari emulators for it. I was also able to to get host file access with Beta DOS instead of MinT which I had toggled of expecting better compatibility. But this problem remains on my Linux system as horribly as before. Only about 20 per cent of the programs that run with MagiCMac are working. Can I fix this by changing some settings?
Any advice welcome.

regards Ludwig

Most problems come with fVDI for 2 reasons:
- There is no vectorial font support compare to speedogdos or NVDI and
some software need it as Papyrus X
- Video acces is not avaible, all software directing acces video will crash

Solution: Remove fVDI, add vectorial font with speedogdos. Removing fVDI
will do able to use Falcon video mode with direct video acces (Videl),
compatibility will be highly better, but speed will be very bad
unfortunatly, and high video resolution not allowed (the same as a
Falcon in fact)

>Any advice welcome.

If you tell us what programs you have trouble with, we may be able to
help you. Perhaps there is indeed some setting etc that would help, and
otherwise it might at least be possible to let you know if there's any
chance of those programs ever working under ARAnyM.

The ARAnyM developers definitely want to fix bugs!
(But it's entirely possible that the programs in question won't work
for reasons that aren't actually bugs.)

The best place to talk about your problems with ARAnyM is likely the
ARAnyM user mailing list (see aranym.atari.org).
But if you don't want to join that, feel free to email me.

This is not really a problem, since NVDI works perfectly well together
with fVDI, as does SpeedGDOS (not old versions).

And the very latest version of fVDI actually does support vector fonts
(using FreeType2), but this is still in its very early stages and not
a whole lot of software realizes the vector font support is in there
(I'm working on implementing/faking support for the various mechanisms
used to detect it).
I still haven't gotten my web site up and running again, so the only
way to get hold of the latest fVDI version is to send me an email (or
download the sources via CVS and build it yourself ;-).

>- Video acces is not avaible, all software directing acces video will crash

This _shouldn't_ be a problem for GEM software, but I have also seen
programs do that (including big commercial packages) for no good reason.
:-(

Often they only do it to check the screen layout (plot a pixel or two
and read back the contents of the frame buffer). But it's entirely
possible to do that using 100% VDI functions, which does work fine
under ARAnyM+fVDI.

Hmm. I just had an idea!
It might be possible to allow restricted reading from the screen for
the purposes mentioned above. If we fool the software into reading
from a fake frame buffer, it might be possible to intercept those
accesses in the same way we intercept hardware accesses, and do the
necessary blits from the real screen on the native side.
I need to try this out...

>Solution: Remove fVDI, add vectorial font with speedogdos. Removing fVDI

Or keep fVDI and add vector font support with SpeedGDOS or NVDI. ;-)

You need to remove NVDI's standard screen driver for this to work
(they're called something like *DRV.SYS, IIRC).
I don't think SpeedGDOS requires anything special done, but it does
need to be run after fVDI, as does NVDI.

>will do able to use Falcon video mode with direct video acces (Videl),
>compatibility will be highly better, but speed will be very bad

The speed could be improved a bit, but I don't think any of us who
work on ARAnyM see that as a priority.

When you can use fVDI with ARAnyM's native code support, things are
a _lot_ faster (absolutely blazing speed with the recently developed,
but still not 100% finished, OpenGL screen driver) and you can have
32 bit colour in high resolutions.

Olivier is right. With the http://eureka.atari.org/xa-my-aes.zip boot
disk image, there's the way to access to the most compatible config
of ARAnyM. In this configuration, most of the 'Falcon programs' will
work.

The way to proceed is to boot with the image under MyAeS (default)
and to disable fVDI TSR, renaming C:/AUTO/FVDI.PRG. Then you should
use the 'configTOS_4.04' example (instead of default 'config') with the
original ROM image.

You will then boot in a 640x480 resolution with 256 colors, and almost
be able to do what you would do with the real original Falcon.

This is the good way to be sure about what ARAnyM can do, and what
it can't ...

I hope it'll help.

Regards,

So rather than simply ask for help or admit that you're clueless, as TOS 4.04 will guaranteed need an HD driver just like it does on a REAL atari, no instead you yell and curse out the community? You're forever flagged in my book as a complete ass. I don't know if I'll ever offer you even the slightest bit of respect again. You're just LUCKY that other people around here are SO MUCH NICER than they ever should be. And your comments about compilers and assemblers was just fucking hilarious! I mean it's such a stupid comment that it goes out of its way to prove how ignorant you are. It's really quite simple, Aranym is not perfect out of the box and requires quite a bit of configuration usually - this is mostly due to how EXTREMELY FLEXIBLE IT IS. There isn't shit for falcon games that work on MagiCMac or MagiCPC, but they CAN WORK on Aranym. Has ANYTHING you EVER USED ON THE ATARI including THE HARDWARE ITSELF ever worked 100% properly without requiring you screwing with everything? No! That's practically the spirit of Atari itself ;-) So that's my $0.02. I felt someone needed to remind you of what trash you are.

> from Best electronics. Oh well, perhaps someone else can benefit
> from those files.

Received the two chips in the mail today -boy, that was quick!
Looks like a reputable and serious company to me: quick replies,
quick sending of the items and good packing. They even do Paypal,
which is good for me, living outside of the USA.

Ok, so I have the new chips here: a GAL chip (they've been
referred to as GAL chips many places, but I've recently been told
they are PAL chips and can be reprogrammed if needed, just like
EPROMs) for high-density floppy drive support, and one GAL for
68881 math co-processor support.

The high-desnity floppy GAL is a "TIBPAL20L8-25CNT" chip by texas
instruments. I suppose (but don't quote me on this as I'm only
guessing!) that this is a "20L8" GAL chip?
Furthermore, it's marked with the numbers "C301901-002" which I
believe is the Atari part number.

From the abovementioned GAL data file archive available at
Rodolphe's site, the data belonging to it must be the
"MSTE_UA2.JED" file.

Moving on, I received another PAL/GAL. This one is for 68881
support and goes in a socket marked "UB-1" which you'll find if
you remove the leftmost ribbon-cable from the motherboard to the
VME-card connector.
It's a chip marked "TIBPAL16L8-25CN" which I assume is the same
as a "16L8" PAL, but again.... you guessed it! -don't quote me on
this. This is also a Texas instruments chip.
Further markings (as an Atari identification part number I'm
sure) is: "C301903-001".
The correct data file for that chip from the abovementioned
archive should be "MSTE_881.JED".

I would be very interested to hear if anyone with a GAL
programmer is successful at reprogramming these chips, or blank
ones, so they don't need to buy chips from Atari dealers like I did.

I've been in touch with Rodolpe, who's behind the website with
those files. He's explained that the two other files are for some
other projects, though I'm not sure what. Apparently they have
nothing to do with the Mega STe.

OK. I'm working on my Mega STe as I'm writing this. I've inserted
the two new chips. The connecting wire between the high-density
GAL and the 68000 microprocessor is already there as I did that a
couple of weeks ago, but I read something strange in the German
"Chips'n chips X" file. In German it says:

```
-----------------------------------------------------
Wenn die 1.44MB Floppy nicht zuverlï¿½ssig durchformatiert,
kann es am Netzteil des Computers liegen. Die Partnummer
muss mit -002 enden. Wenn es ein -001 Netzteil ist, muss die
mittlere Platinen- Schraube entfernt werden. Ausserdem muss
der Stehbolzen, in den die Schraube gedreht war, gegen die
Platine isoliert werden. Klingt zwar alles merkwï¿½rdig, ist
aber tatsï¿½chlich so. Bei der Gelegen- heit kannst du auch
gleich nachsehen, ob der "richtige" Optokopp- ler SHARP
PC111 eingebaut ist. Wenn es ein CNY17 ist, kann der
Bildschirm ein wenig flimmern.
-----------------------------------------------
```

And translated by DDP (from the discussion thread "Re: German
text needs translating -anyone?" on the 21st of June 2005), it means:

```
-------------------------------------
If the 1.44 MB floppy does not format reliably all the way
through, then this could be due to the power supply unit of the
computer. The part number must end with -002. If it is a -001
power supply, then the central PCB-mounting screw [presumably of
the power supply board - Translator] must be removed. In addition
the pillar into which the screw fitted has to be insulated from
the PCB. Although all this sounds strange, it is really the case.
While you are at it, you can check whether the "correct"
opto-coupler SHARP PC111 is present. If it is a CNY17, the screen
may flicker a little.
-------------------------------------
```

This really has me puzzled!!!!
I have absolutely no idea which screw they're talking about. Yes,
my power supply does have a "-001" suffix. There's a big, printed
label which rates the input/output voltages, power rating etc.,
then there's a small, white paper sticker next to it which I
assume is the Atari part number. It reads "C301379-001".

What I've done now is open it up.
After removing the power supply from the Mega STe motherboard

(careful!!! The power connector that goes from it to the motherboard is really hard to remove. I had to wedge a screwdriver in between, so be really careful that it doesn't slip and scartch up the motherboard!!!!!).... I removed the screws on each side of the metal enclosure. There are 4 in all.
Then remove the two (long) top screws that go through the cooling fan (you can leave the two lower screws alone).
When that's done you can slide the top metal-cover off the power supply unit.

OK. I'm looking at the power supply circuitry now. Let's see.....
Yes, there is a mounting screw in the centre area of the power supply circuit board. It's next to a black/yellow transformer (there are two transformers in total -this is the biggest one. The smaller one is closer to the power switch).
This must be the screw they're talking about. But I don't feel like removing it just yet. I'm going to re-assemble it, and try out the computer first.

But while I'm at it I'm also going to check for that opto-isolator. I do find a "Sharp PC-111" as one of the two chips on the circuit board. It's towards the opposite end of the switch/fan, and is an 8-pin IC.

OK, ready to try things out. I'm not bothered to re-assemble the metal cover to the power supply (in case I have to open it again), so I carefully re-insert it on the Mega STe motherboard, re-plug the cables, as well as the cables for the hard drive, floppy drive etc.

Keeping my fingers crossed while turning on the power.....
Ouch!!! the screen flickers and I hear a loud "brrrrrrr!!!". Not a good sign, so I immediately turn off the machine, unplug it, and open it up again to see if there's something I've missed.

Ah!!! The monitor connector was plugged in the wrong way (a bit worn after having been unplugged so many times). This is better. The TOS 2.06 "Atari" and its logo comes up along with the memory test. The AUTO programs, ACCessories etc. load. Booting never seemed this long!!!! I'm holding my breath as I insert a 720Kb (DD) floppy that has worked fine before. Yup. The files, come up, so at least I haven't damaged anything :-)

Then comes the ultimate test: I've prepared a HD floppy disk on the PC, with a variety of files. I insert it in the Mega STe floppy drive and hold my breath for what seems like an eternity........

YES!!!! It reads the HD floppy disk. It works!! I'm overjoyed :-) I can finally use "normal" floppy disks (a bit behind I must admit in a time when Macs aren't even equipped with floppy drives, but better late than never... ;-)

Ready for step 2: I try to format the floppy from the TOS 2.06 desktop (yes, the approproate DIP switch on the motherboard is turned on for the HD format option).
Formatting defaults to "double density" for some reason, so I assume there's no detection of any kind as to what kind of floppy has been inserted (bummer!!! I spent a long time working on the STe (not a MEGA STe, but a plain STe that is) to be able to automatically detect the floppy used -maybe something can be done with the Mega STe in order to make it work here as well).

OK, I select "high density", then click on "Start". After a while a message comes up saying I have 1459200 bytes available, which must be a good sign :-)
I copy a few files over from the hard drive to the newly formatted floppy, then insert the floppy into the PC's disk drive. Yup, I can read the files just fine :-)

So in summary: I've managed to give my Mega STe high-density floppy drive support! Hopefully this (long winding and detailed) "story" will help others make it work, without the black smoke risks I've taken ;-)

All's that left now is to get hold of a 68881 and see if I can be just as successful to get that working.
Anyone have a 68881 for sale? Not a 68882 as I've read here that they can cause problems with some programs.

Please calm down ... The error was acknowledged. So it is almost
forgiven. You know that this person was horrified by having to
install Windows on his Linux Box ... He was on a no way end, and
desperate ... Words have gone much further than his real thoughts.

In France, we have real rude words for each other sometimes.
But all ends with a great banquet, everyone laughing and a
dumb bard ;) The diplomacy would expect you to forgive, noticing
that he is not speaking his mother tongue, and that it is probably
a real pain to express himself clearly.

Anyway, he was really rude. I wish that nobody will ever express
himself that way again. That's a real shame on him :(

Best regards Mark,

Hallvard Tangeraas wrote:

> YES!!!! It reads the HD floppy disk. It works!! I'm overjoyed :-)

A correction/addendum to my previous message...
I tried running "Hcopy" (an MSDOS compatible formatter/copier
which I prefer to the TOS desktop formatter) and it froze every
single time.

I removed the 68881 GAL chip I had just received (I popped it
into its socket even though I haven't gotten hold of a 68881
yet), and it worked fine.
So it seems like that 68881 GAL causes problems if it's installed
on its own. Just thought I'd mention it.

Hi Hallward

Congrats! Nice work!
Unfortunately i did not manage to get my MegaSTe in HD mode, even
though I have the correct PAL chip and cleared the connection to the
68000.
So now I have ordered an AJAX chip to replace the WD1778ph-02-02.

Is it your modified HD-drive you are using? As I can see on your drive
description, there are not any circuitry alterationï¿½s although the
physical alterations may com in handy!

Do you think that my german TOS2.05 is the problem. Iï¿½m working on
purchasing some new ROMï¿½s and program the english version of TOS2.06
into them.

Sincerely
Peter, Danmark

LOL,

Francois, you're probably right. I guess I just don't understand other cultures completely sometimes. But it still ticks me off a bit ;-) I just imagined myself being on the receiving end of that over Gim or something without even being given the chance to properly help someone out with it. But the difference is, Gim is a piece of crap whereas Aranym isn't, despite the arguments over emulators, etc. Aranym is HUGELY useful to me so I don't want to see developers get offended and quit.

And I understand especially French rudeness as it's a bit more toned down than that. He just had some exceptionally harsh things to say - things which simply cannot be taken out of context.. They are what they are.

Thanks Francois,

Mark

Did you check your power supply as mentioned in that other
posting of mine? Might be worth trying out.

> So now I have ordered an AJAX chip to replace the WD1778ph-02-02.

That might be a good idea anyway, but I would assume that a
1772-02-02 should at least work now and then if not always. If
you had no trace of it even once being able to read a HD floppy I
think the problem is elsewhere.
I've been told by Best electronics that many Mega STe machines
have problems with HD floppy drives, being RF interferences or
other things. Try moving the floppy drive cable to another
location inside the machine, or even try it out without the top
plastic casing.

> Is it your modified HD-drive you are using?

Yes. I'm curious however if a non-modified HD floppy drive would
work. But I assume that in any case the drive 0/1 issue still
exists, so that would have to be done.
As for the other modifications, I'm not sure.

> As I can see on your drive
> description, there are not any circuitry alterationï¿½s although the
> physical alterations may com in handy!

Yes -it's absolutely not necessary to cut the casing!
I know this is common practice for many Atari users -to use a
craft knife and cut a big, ugly hole just because the eject
button is different.
Personally I don't want my computer to look "butchered", but
that's just me ;-)

> Do you think that my german TOS2.05 is the problem. Iï¿½m working on
> purchasing some new ROMï¿½s and program the english version of TOS2.06
> into them.

Hmm..... could be! I know that there are some issues with 2.05,
but not sure what.
Could it be that TOS 2.05 doesn't have the HD support that 2.06
has? In any case I think you can use a HD cookie setter program
instead, in the AUTO folder, or just run it once, manually.

> Peter, Danmark

That's not far away from here ;-)
Almost neighbours. hehe..

Source record: 12891

Small update:
I find that when I return to the Manager window I have to move the window (a very small move is enough) so that the top bar updates. This is easy to do because the move bar is near the calendar icon.
Alternative method: Assuming you have Manager module window active. Use ALT+CONTROL + H to switch to main modules window. Change date as described. Hold down the ALT & CONTROL keys press S then H then S. You should now be back in the Manager as active window. Click the Calendar icon and dates should now be updated. This may be the faster method, it uses Harlekins built in macros to switch active windows.

As always only try this if you assume total responsibility for all effects. It works well
for me. Be aware that in Gemulator on Windows 98 changing the date in Harlekin as described
also changes the Windows 98 system date. That may or may not be desirable but it is easily
reversed either from Harlekin or in Windows.

regards
BJ

On my CT60 Falcon I can get past Doom's splash screen, but it freezes (as did previous versions) shortly into the game (both playing and with the demo before you play). Heretic does the same, but it lets me make it much farther in. I've actually gotten a number of levels in before it happened. Don't know if it makes the difference, but I'm running it on Magic instead of Mint.

Oh, one more thing...

What do you do to enable the GEM mode in Doom? I read the instructions, but I must be missing something, because no matter what I try typing into the .ttp parameter box, I can only get 320x200 fullscreen mode. The same with other Linux ports (such as M Player) that are supposed to have a GEM mode. Could someone give me a line that I can more or less cut and paste into it to get the GEM mode running on any of these programs? Thanks!

SDL programs are configured with ENVIRONMENT strings, not in parameters.

Floppy?

I have also encountered this problem, my conclusion was that the PC floppy drive will not write more than 720K to the disk, as disks were often formatted like this to squeeze upto 800K onto them the result is that the software fails to write back the final track/sectors to the floppy and returns an error message instead.
If there is a real solution to this I would also like to know what it is, a work around is to look at the files in the image and try to remove any you don't need such as large text instrunction files, or duplicates of the program file
(eg oni in the root directory and the Auto folder) if you can get it down to 720K copy the files to a blank disk image and then write that back to a normal floppy.

In fact this is not a good reason because in AES there is no way to do
any video access all is in VDI, in fact all VDI software should not use
video direct access! AES have nothing to do with this except manage
windows and screen semaphore. Yes a lot of software done this sort of
trouble, I think some for video detection perhaps, Calamus for example
do this (Calamus is very strangly write and not clean at all I think, a
part possible for it's protection)

I do exactly this in screen.ldg, but now there is EDDI cookie to find
video format.
>

> I need to try this out...
Already just support logbase() physbase() with by default a buffer of
the size of the screen and support changing it, there is an option in
fVDI to do this for a part I don't know if all is support, but some
software can run when this option is avaible (Calamus can start for
example), this is done by MagicPC, this buffer is even use by this
software to save restore mouse background (I think when VDI write
something in the screen, it copy it in this buffer), when you use a
software writing directly on screen, and you move mouse I can see what
the software have draw!

Hi Tolkin!

Assuming you are doing this on the Atari, try FastCopy III or Pro.
It was shareware but I have seen it on various PD disks. I must
admit I have not tried its 'Image copy' function but it ought to
work.

Regards, /Peter/

Hy, do you mean to copy the image of a disk to a normal Atari ST Formatted disk, and then write the image "unpacked" onto another disk using the Atari ST?
So on which kind of PD-Disk is it? Or where it can be?
I will look for it ;)
Thanks for help..

The way I do it:
- buy a Null-Modem serial cable
- plug the ST to the PC thru the serial ports
- download Ghostlink and run it on both machines at 19200bps
- donwload "MSA2ST" for Atari, or other tools for .ST images
- now you should be able to access your PC drives as if they were ST drives, and thus can use easily the real ST to write back any kind of MSA/ST file stored on the PC.

Problems:
- it's rather slow
- not sure about this if you run XP on the PC

Cheers
Simon

Under MiNT, you can add the line 'setenv SDL_VIDEODRIVER gem' in mint.cnf,
or run a shell in tos2win to modify the environment variables. Maybe
something like this is possible under Magic. Unfortunately, this is not
easy to do under TOS; using a front-end application (todo) could be a
solution.

For the crashes people experiment, it seems to be a bug in IKBD SDL
driver, so try GEM video driver if you can. I am investigating this. And I
also made many fixes in the game engine, v0.41 is ready (along with
Heretic), waiting for the IKBD problem to be solved.

Source record: 12805

Hi there,

I have compiled it, installed it from RPM, tried x86_64 and i386/i586,
but no matter what I do ARAnyM starts, finds all the stuff it requires,
and then segfaults...

I'm running SuSE 9.2 Pro on an Athlon64 3000+, using a fairly clean SuSE
setup.

I've tried mailing to the aranym list, but no-one answered my question.
I see a few aranym threads in here so this is my last chance...

Does anyone have an idea what I can do to stop these segfaults? All I
want to do is run a virtual Atari on my Linux setup, because I miss my
Falcon030! (sold it to a guy in Australia!) :-)

I added the SDL_VIDEODRIVER=gem variable to Magic, and now when I run
Doom, after all the initialization stuff, it briefly opens a small GEM
window, but then the whole screen goes black and nothing else is ever
displayed.

Anyone else had success with running Doom in a GEM window with Magic? I
know it's many times faster in Magic than in TOS, so the added
stability and functionality would be a welcomed sight!

If anybody here is near Chicago on July 16th, you can test the retail version of it (first time anywhere) at the 8-Bit Classics booth at VGS. Here is the press release:

Atari Video Club/Jaguar Community United is proud to announce that with help from Corey Koltz of 8-bit Classics (http://www.8bitclassics.com) and Curt Vendel of the Atari Museum http://www.atarimuseum.com/) that The Atari Flashback 2.0 game console will take it's first midwestern appearance at The 2005 Video Game Summit in July before it's inital release in August. This will be it's first public showing in full retail form. The Atari Flashback 2.0 made it's first southwestern appearence at the Okalohma Video Game Expo on June 18t(before that it was shown at the Electrontic Entertainment Expo back in May). The Atari Flashback 2.0 features 40 built in 2600 games all using actual 2600 technology (some games are classics but there are a few new homebrew games included). Plus the controllers are interchangable with classic Atari controllers. Stop by the 8-bit classics table at VGS'05 to check out The Atari Flashback 2.0 and flashback to the 70's when you got your first 2600.

The 2005 Video Game Summit will be on July 16th,2005 from 9am to 6pm Fairfield inn and Suites (Heron point building), 645 West North Ave, Lombard, IL 60148.

Join the Video Game Summit mailing list for updates on the event (VideoGameSummit-Subscribe@yahoogroups.com) Visit the VGS website: http://avc.atari-users.net/Events/FestVGS.html

For more information about Video Game Summit contact Daniel Iacovelli at AtariVideoClub@yahoo.com.

Cab is currently your only choice. I'd suggest buying a PC. $299 at
Walmart (or less if you get some older one). You could also get by using
an old dirt cheap PPC mac (under $100). Rumors abound that CAB can do
Paypal but only under MiNT which won't work out with 4MB. You'll have to
get a Falcon or a TT to even try, and I've never gotten it to work in CAB
despite other people's reports. If you check a local college, decent PC's
and Macs are often trashed and free.

I have Aranym on AMD64 too. What you need to use is the i386 NON-JIT
version. The debian package has aranym, aranym-jit and aranym-mmu in the
same deb package. Aranym is supposed to work on AMD64 for non-jit
binaries but I've never gotten it to work and even one of the dev's
hasn't on my system. You also need the 32bit compatibility libraries for
SDL but it sounds like you already have em.

My working binary is on http://aoi.atari-source.com/~mduckworth/aranym

Thanks,
Mark

Source record: 12819

Small update:
I find that when I return to the Manager window I have to move the window (a very small move is
enough) so that the top bar updates. This is easy to do because the move bar is near the calendar
icon.
Alternative method: Assuming you have Manager module window active. Use ALT+CONTROL + H to
switch to main modules window. Change date as described. Hold down the ALT & CONTROL keys press
S then H then S. You should now be back in the Manager as active window. Click the Calendar icon
and dates should now be updated. This may be the faster method, it uses Harlekins built in macros
to switch active windows.

As always only try this if you assume total responsibility for all effects. It works well
for me. Be aware that in Gemulator on Windows 98 changing the date in Harlekin as described
also changes the Windows 98 system date. That may not be desirable but it is easily
reversed either from Harlekin or in Windows.

Maurice

2444. Re: Announcing: STinGadel

Newsgroup: comp.sys.atari.st
Date: 2005-06-29 14:55:24 UTC
From: toothy_grin@theglaholts.net
Message-ID: <wDywe.1102$Si3.868@fe06.lga>
Source record: 12821

Greetings, everyone!

I am very pleased to announce that STinGadel, the Atari ST multi-user Citadel-type bbs program, is now in 'Beta' mode. I've put up my bbs, Cold Winter Knights, using the software as the official beta site.

I would like to welcome anyone and everyone to log in and give it a test run. Please remember that it *is* on an Atari 1040STe, and as such, it may be a bit slow, relative to today's supra-high-speed machines.

STinGadel's features:
"Room"-based citadel-type bbs system: Each room is a message topic. One can 'goto' each room with new messages, or just 'jump' to a specific room. One can read messages with "F" (read all forward), "R" (Read all reverse), "L" (Latest # of messages), and "N" (New since you last read the room).
* Up to 24 simultaneous connections allowed; each connection is continuously 'polled'.
* VT100-enabled "IRC"-like chat mode.
* Up to 128 rooms
* Sysop-configurable: message memory cache (for speedy message reading/access), message base size, userbase size, menus.
* Note: There is *no* console mode. All connections *must* be from and through STinG for the moment. I *may* add a console mode, but the stock ST's screen drawing subsystem is *SO* slow, and thus everyone else would slow down.

Requirements:
* Atari ST machine (only originals have been tested; I would like TT or Falcon testers, if anyone is even remotely interested)
* 4 MB memory. (for speed purposes, almost everything is contained in memory, requiring a great deal of free space)
* 10 MB hard drive space -- probably not a problem
* STinG connection. Theoretically, a continuous modem connection *would* work, but who would want that, really -- I'd *HIGHLY* recommend an ethernet (I use EtherNEC personally) connection.
* A static IP, if you want people to be able to log in. :)

Log into Cold Winter Knights BBS with a VT100/ANSI/XTERM connection by telnetting to bbs.coldwinterknights.net

Also, I'm going to continuously update the web site (http://www.coldwinterknights.net) with big sightings, fix-lists, etc, suggestions to be implemented, etc.

One final note, if I may: Remember that it *is* in Beta. I fully expect it to crash during the beta testing period. If you attempt to telnet in and find it hanging, or cannot connect, and so on, that means it's down until I can figure out what went wrong. Thanks for reading, and happy Atari-ing!!

Reading between the lines, could be that this screw is meant to ground
a pad which is meant to control output from the PSU. Next time you have
the unit out see if you can verify this?

>Hy, do you mean to copy the image of a disk to a normal Atari ST Formatted
>disk, and then write the image "unpacked" onto another disk using the Atari
>ST?

No, what I meant is downloading the image onto a hard disk on the
Atari and then doing an image copy to the floppy. But if you don't
have a hard drive on the Atari or it is not connected to the web,
this won't work.

If you only have connection on the PC, the problem is that the
latest PC OSs won't read or write extended floppy formats - but
Windows 98 will, so perhaps you could use your laptop? Format
the disk to 10 sectors 80 (or more?) tracks on the Atari and W98
should read the disk OK, so you can write the *.msa file to it.

Otherwise, there are apps that allow you to split a file into two
or more chunks, and reconstitute them later. There must be one for
the PC, hopefully compatible with the Atari ZIPSPLIT.PRG and ZIP-RBLD.PRG.

>So on which kind of PD-Disk is it? Or where it can be?
>I will look for it ;)

Your best bet is on the Belgian Atari server
ftp://chapelie.rma.ac.be/atari
but it should be in some Maus groups too.

The alternative is to link the Atari to the PC via a null modem cable,
as Simon describes in his message.

2452. [UTD] July Release of Eureka

Newsgroup: comp.sys.atari.st
Date: 2005-06-29 18:12:10 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <42c2e47a$0$911$8fcfb975@news.wanadoo.fr>
Source record: 12750

Hi,

The software "Eureka" is updated and released on its WEB page.
It is a "2D Graph Describer and 3D Modeller". You will have to
fetch it at :

http://eureka.atari.org/eurka507.zip
That is the Complete Common Edition

http://eureka.atari.org/eurka020.zip
Is the Complete 68020 Edition

http://eureka.atari.org/eurkafpu.zip
Is the Limited FPU Edition

http://eureka.atari.org/eurklite.zip
Is the Lite Edition, working on early ST with 720kb floppy

http://eureka.atari.org/lib_dgem.zip
Are Dynamic Libraries Extensions for Eureka

http://eureka.atari.org/tiny045.zip
Is the OpenGL Extension (requires previous package)

The main novelty of this release is the add of 43 3D
FMU shapes coming from the K3DSurf software from
Abderrahman Taha.

I wish you big fun with all this new STuff !

Best regards,

-- François LE COAT
Author of Eureka 2.12

Except for all of the classic games they're re-releasing...

http://www.atari.com/us/genre/arcade

* "Retro Atari" for the Gameboy DS (which is apparently pretty awesome,
though I've never even tried a DS, let alone this game)

* Atari Anthology for PS2 & XBox

* Atari: 80 classic games in one (Windows)

* Atari Arcade (Windows)

* Atari Anniversary Edition (Windows)

* Atari Flashback (a stand-alone console with built-in games;
not so well-received)

* Atari Flashback 2.0 (coming this summer; highly anticipated)

Hy, i have tried it with my Win98 and Dos "Slave-Book" but that was not
succesfull :(
I have a HD on the ST, but no cable for it :(And i do not know if it
works...
But i will try the Seriel cable and the MSA Writer... Maybe this work ...
Thanks

Atari
| >ST?
|
| No, what I meant is downloading the image onto a hard disk on the
| Atari and then doing an image copy to the floppy. But if you don't
| have a hard drive on the Atari or it is not connected to the web,
| this won't work.
|
| If you only have connection on the PC, the problem is that the
| latest PC OSs won't read or write extended floppy formats - but
| Windows 98 will, so perhaps you could use your laptop? Format
| the disk to 10 sectors 80 (or more?) tracks on the Atari and W98
| should read the disk OK, so you can write the *.msa file to it.
|
| Otherwise, there are apps that allow you to split a file into two
| or more chunks, and reconstitute them later. There must be one for
| the PC, hopefully compatible with the Atari ZIPSPLIT.PRG and ZIP-RBLD.PRG.
|
| >So on which kind of PD-Disk is it? Or where it can be?
| >I will look for it ;)
|
| Your best bet is on the Belgian Atari server
| ftp://chapelie.rma.ac.be/atari
| but it should be in some Maus groups too.
|
| The alternative is to link the Atari to the PC via a null modem cable,
| as Simon describes in his message.
|

>

Not yet, but that's a great idea - and pretty easy addition. I will
get to it as soon as possible!

For the record, the Beta board is down at the moment; someone connected
via a terminal that asked for some strange telnet information that I
need to deal with. I'll be working on it when i get home from work and
get it back to going again.

May I suggest the following:-

1) make a PARCP cable and get a copy of the software. It works very well.
Its much quicker than any of the serial solutions I have tried.
The software is cheap (will work as unreged)., the cable is easy to make, I
chopped the "centronics" connector from a printer and soldered a D25 on to
replace and make the cable, and its reliable.
2) Assuming you have a "reasonably" sized ST (say 2Meg) create a RAM Disk on
the STE.
3) copy the image to the ST using PARCP and unpack on the STE.

As I have a hard disk, I have not tried using a RAM disk but I can't see why
it won't work, unless you have a base (1 meg) atari.

2463. Paskud -> IDE -> Compact Flash card - anyone tried this?

Newsgroup: comp.sys.atari.st
Date: 2005-06-29 20:48:04 UTC
From: Mike Mee <usenet@NOSPAM.mikemee.plus.NOSPAM.com>
Message-ID: <MPG.1d2d148248c16836989680@usenet.plus.net>
Source record: 12835

Thinking of replacing my ancient and noisy 100MB h/drive with ICDLink etc on my Mega STE if (and only if) I can get the following working.

In theory:

1) Paskud Interface into cartridge port
2) Instead of attaching IDE device, attach an IDE->Compact Flash card reader from various sources on eBay
3) Insert 128/256/512 Compact Flash cards as and when needed and boot off the drives ...

Anyone else tried this .. I've emailed Paskud and he's said in theory that this is possible, but he's not yet tried it himself?

Short of buying one and sending it to him to confirm, I don't want to take the giant leap .... (albeit a peaceful one compared to my current h/drive!)

> a small GEM window for a fraction of a sec, then a crash.

Remember the GEM driver is usable only with 8 bits or higher depth (256
colours or True colour modes).

Good news: I found the bug in the SDL IKBD driver.

Bad news: I think this is not related. I had problems in previous versions
with the audio, so I think I will make it back switchable on/off.

About Magic: I don't have it, so I can not test anything. I will try to
fix SDL stuff with Magic users, but it will take time.

the drive select needs to be altered, you may have better luck using the
twisted cable and maybe trying drive B: on the PC.

Control the output? I'm not sure what you mean.
Are you saying this is a fine adjustment for one of the output
voltages?

Right now the Mega STe has been put together again, but if I get
hold of a 68881 I'll be opening up the machine again to install
that, though I'm not sure about opening up the PSU again, but
we'll see. I'll post the results here if I do.

Any other Mega STe users who can look into it?

Uwe Siemet did some testing of CF cards and noted that they behave pretty much the same as IDE drives do. Thus I think you can assume the IDE interface would work. It's on my to-do list to try, but I've got CDRW problems at present to deal with.

One thing to note is that CF cards are only good for a few hundred thousand write cycles. You will need to also use a RAM disk for Internet (and other) caches if you want the CF card to last more than a year or two. As a read-only drive, life expectancy exceeds 10 years.

Galen

This option is set in the NVRAM among other things. You require one of the many programs that can alter the NVRAM. I use bootconf.cpx myself.

Or you could go for the CF Micro-drives instead. As these are mechanical you dont have the CF's flash write limitations, but you do inherit the potential problems of normal harddrives. Saying that I know of a handful of pro photographers that have been abusing these cards for years without problems. You may get one reasonably cheap. Last time I looked, in certain capacities they were cheaper than the Flash based equivalent (maybe 4/5Gb?).

FYI, I had problems with my Stacy, an SCSI=>IDE converter, an IDE=>CF converter, and a Viking 512mb CF card. I have a new CF card which I have to try out, but the Stacy has gone to a better home now so I'll do the testing on the MegaSTe (same crappy host adapter though). I guess this is what let the experiment down, and I reckon you'll have better success with the Paskud IDE adapter.

Yes, all the required 32-bit libs are there. I was hoping that I could
continue to use JIT, since it ran very nicely on my older AthlonXP.
I've downloaded 0.9.0beta2 x86_64 compiled for SuSE 9.2 Pro and it
doesn't work either, which makes me wonder why a package created for
x86_64 doesn't work *on* x86_64 hardware and the same OS it was quite
possibly compiled on...odd is what it is! :-(

> My working binary is on http://aoi.atari-source.com/~mduckworth/aranym

I'll have a bit more of a play, then maybe give your binary a go.
Thanks.

This is technically not possible (unless you are talking about USB floppies or such). The *drive* has no idea about the track layout of the disk. Any drive supports extended formats with more or bigger sectors than nomal for this reason. As a matter of fact, some "extended formats" are windows standard, Microsoft used those formats for software distributed on floppies.

A specific drive might have a limitation on the number of tracks, but *not* in the number of bytes and sectors per track. The limit per track is exactly the same for all drives and it depends only on the density.

The problem is most of the time the OS. That's why you need to use Win 95,98, Linux or plain pure DOS. In some cases it might be a limitation of the controller as well. But the drive should never be a problem for an image consisting on 80 tracks.

Keep in mind that Paskud interface is not compatibile with AHDI/XHDI
(so, no Magic or MiNT or any AHDI/XHDI tool).

But yes, it should work with Comact Flash cards.

Verily, it was written by Coda <smeg_007@hotmail.com>:
> Wasnt me! :-)
>
> The reason why I would need it to listen on a different port is that I
> already run telnet on port 23, but actually I cant think of a reason
> why I cant move the telnet service instead.

grin I know it wasn't you -- it actually was someone on a MOO that
I talk to all the time. Fortunately, he was able to tell me just what
he did..

And, through the research of that, I completely revamped the telnet
preprocessing negotation/handshake routine. It is now far *FAR* more
durable and bullet-evasive than before. (it's in beta, after all, so
I can't say 'bullet-proof' *JUST* yet.. heh)

Anyway, it's back up now.

Again, thanks for the suggestion, Coda - it's on my short (but ever
growing) list of additional features. :)

Its most likely just an issue with a local ground loop and removing the
screw eliminates this and the attendant noise /instability.

Message-ID: <da0gen$fi4$1@nwrdmz01.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 12762

If wanting to 'dump' as .ST disk image onto a disk which can be
used/bootable on an Atari ST, do the following;

1. Use DOS or a WIN95/98 DOS box as your O/S, you have to boot from a HDD!!
2. Add the crucial command to your config.sys file for this to work;
DRIVPARM=/D:0 /C /H:2 /I /S:11 /T:85
3. Get hold of the DOS application ST2DISK, here;
http://www.8hz.com/stdisk/

That's it!! Do note that once that DRIVPARM entry is made that you won't be
able to use your disk drive with normal 720K or 1.44Mb disks so it's best to
'REM' it out except when you're using it. That means that you have to boot
from a hard disk, as the PC will balk the moment the disk parameters are
changed if trying to boot from floppy.

If wanting to run on anything higher than WIN98, forget it!! Also, this
procedure is shaky on even WIN98 with some of those older 'integrated' baby
AT motherboards. This is confirmed as working on an IBM ThinkPad 755C
laptop, and also a Toshiba Tecra 8000 laptop. My oldish 98 desktop PC
didn't like it one bit with the drive going crazy after a few images and
needing a reboot. These laptop drives will also go to 11 sectors and 84
tracks. Actually, most older FDD drives will do 84ish tracks but the newer
PC ones today aren't really Shugart industry standard drives so I've avoided
them but they may work..

Also.. The creme de la creme of disk controllers are the Promise IDE/FDD
Cache controller range as these support ALL of the weird and wonderful disk
standards right down to SSSD.

Hope this helps. You can take any .ST image, namely the Automation cracks,
and they work on an ST.

See Steve's reply, I was thinking this might have controlled a current,
NOT voltage! limit. But then again a jumper would have been a better
choice.

There is no way to use the TT's SCSI port instead? This is faster and
more powerful than ACSI with the ICD adapter anyway.

Heh, it was indeed. the original STadel/Inner Sanctum code was purely
single-user. I had to rip out the original guts, due to the fact
that it was single-user was *so* infused into the system as a whole.

I can imagine it would be a similar experience for BBS/Express. I
remember logging into a lot of Express boards, though. It'd be nice to
see one of them back in action. :)

I was afraid of that. Wish I was a better programmer/had more time. I'd
love to do it.

I logged into your BBS this morning - looks like you've got a good running
start on it. As a fellow Sysop, I know how much work is involved in
running and maintaining a BBS. :-)

As far as seeing a BBS Express! ST board back in action, just telnet to
mine: 24.177.23.74

Like you, I'm beta-testing from where it had been down so long but the
majority of things are okay now.

See ya! :-)

Don't know.. It must work for someone ;) just not me ;) Maybe we have
socket 754 versus 939 or 940 and there's differences.

Anyway, a lot of things run faster on amd64 in 32bit mode. Maybe you
should consider running 32 bit linux?

Thanks,
Mark

ello J�rgen :-)

This might help too;
<http://mysite.wanadoo-members.co.uk/x3peri_mental/STIMAGE2.htm>

Let us know how you get on. It would be good if there was a site out there with original .ST images other than games? The archiving of these seems to have slipped behind a bit to be lost forever.

2501. 68000 DIVU/DIVS cycle accurate timing

Newsgroup: comp.sys.atari.st
Date: 2005-06-30 19:18:45 UTC
From: Jorge <user@nospam.com>
Message-ID: <da1gil$h4p$1@blue.rahul.net>
Source record: 12778
Cross-posted to: comp.sys.atari.st,comp.sys.amiga.emulations,comp.sys.m68k,comp.sys.mac.misc,alt.games.mame

Below is attached source code for computing the exact number of cycles
taken by a specific division on the Motorola 68000 CPU. As far as I know
this information was not (publicly) available before.

Current emulators for 68000-based machines (Amiga, Atari ST, MAC, MAME,
etc) reached an amazing level of accuracy. The exact timing of the
division instructions remained as one of the main inaccuracies because
this is not documented in the available manuals. Hopefully, with this
issue solved now, 68000 emulation can take one-step forward.

The code and algorithm was only partially tested. It is not feasible to
do an exhaustive test on real hardware in a single machine.

Please note the cross-post in several newsgroups before replying.
Thanks to Toni Wilen (WinUAE), Russ Hayward (Steem) and Leonard (Saint).

*/

/*

The routines below take dividend and divisor as parameters.
They return 0 if division by zero, or exact number of cycles otherwise.

The number of cycles returned assumes a register operand.
Effective address time must be added if memory operand.

For 68000 only (not 68010, 68012, 68020, etc).
Probably valid for 68008 after adding the extra prefetch cycle.

Best and worst cases for register operand:
(Note the difference with the documented range.)

DIVU:

Overflow (always): 10 cycles.
Worst case: 136 cycles.
Best case: 76 cycles.

DIVS:

Absolute overflow: 16-18 cycles.
Signed overflow is not detected prematurely.

Worst case: 156 cycles.
Best case without signed overflow: 122 cycles.
Best case with signed overflow: 120 cycles

*/

I've used both ports, the host card had an old BIG (size not storage) ibm drive on it and it worked fine with the host. Plus as my bootup was set up with ICH ult's I don't have the catching now nor the extra folders beyond the 64 limit without the host. I wanted to fire up that drive and see if I could recover the files I put on it and transfer them to the 2ga one inside the machine.

I was surprised to see that the Mega STe doesn't automatically
detect if a HD or a DD floppy is inserted into the drive, or is it?

When formatting a HD floppy using the TOS desktop formatter,
"double density" came up as default as it always has.

Using Ecopy I found some settings regarding this issue. Can't
remember the exact details as I'm not in front of the Mega STe
right now, but there was an "automatic" setting as well as
several "high bit" and "low bit" settings.

Anyone know more about this?

There's a portable method for this in C99. #include <stdint.h> and then use
uint16_t, int16_t, uint32_t and int32_t.

Mines a 754...

> Anyway, a lot of things run faster on amd64 in 32bit mode. Maybe you
> should consider running 32 bit linux?

32-bit software runs fine, but 64-bit works notably faster for the
stuff I do. I have a nice POV-ray render, which takes a 6000x6000
pixel JPEG, textures that onto a 3000x3000 pixel height field map,
and uses area-lights, depth-of-field, media, to render to 720x576
with +A0.0, in under a minute. Meanwhile the same scene rendered
on a 32-bit version takes almost 3 minutes. When I'm animating as
many as 500 frames with this scene I'd rather use 64-bit so it will
not take all day to render. After the render is finished I'm left
with 500 frames at 900kB each. ffmpeg can take those frames and
compile them into a high-quality mpeg2 VOB video file in under
30 seconds. Again the 32-bit version of ffmpeg takes longer, at
around a minute...

64-bit or bust sorry... :-)

You're having such a hard time because your prices are too high. Lower them until sales pick up. Match the economic times. Collectors don't have the expendable income like they did a few years ago. Compare prices on ebay now to what they were before the tech bust. They're like 1/3 what they used to be.

It is interesting that classic controllers can be used with the Flashback 2. If the reverse is true, it might well be worth getting a Flashback just for some spare joysticks (and the occasional gaming session, of course).

I fully understand. I did it from roughly somewhere around '89/90 to about
'98/99 or so.

> Are you using an EtherNEC, then? If I may ask, how is Express seeing
> the connection?

Absolutely you can ask! I'm using the Lantronix UDS10, a serial port to
LAN converter that works great with Atari computers. I heard about it
first from the Atari 8-bitters, who were using it both for BBSs and as
clients directly. It costs more than the EtherNEC (I have one of those
too, btw, bought from Rory), so I don't really know which is the better
way to go. It doesn't tie up a cartridge port, it does have a nice web
based configuration, etc, etc,.. I never tried the etherNEC, to be honest.
It just looked like one of those "gizmos" that I would want to have
someday. I may wind up using it for my Falcon though, until some of
the newer Falcon projects get completed. <grin>

As far as Express seeing the connection, the UDS10 sends a signal from the
LAN to the STs serial port just like a modem would. In fact, thats one of
the options in the config that you have to have set for it to work "modem
emulation". It took me a couple of tries to get it right, with lots of
help from here and comp.sys.atari.8bit, and Marius Diepenhorst (sp?) but I
got it in the end. I had to take the *.mdm files from Express and edit
them, basically taking out all the modem AT* and string commands leaving
it pretty well blank...and that was it, we were up and running.

If you want to see a picture of the UDS10, you can see one at my website
(see sig below).There are also screen shots (not good quality though,
gonna replace those when I can) of the hardware the BBS is running on, as
well as captures from an actual session.

Well, guess I got a little long-winded in my reply there, sorry. I get all
excited talking about Atari, ya know? :-)

See ya!

From: Phantom <phantomm@bellsouth.net>
Message-ID: <If1xe.7723$ho.5255@bignews6.bellsouth.net>
Source record: 12790

I have a suggestion:

If you can find someone near to you that has a similar card, Maybe
they would let you borrow it long enough to transfer your files over.

As far as fixing the board, Just about anything can be fixed but
it depends on the amount of damage. ICs for these boards can
be hard to find if ICD made there own special versions.

A ICD (THE LINK) or (THE LINK II) would be good replacements.
If you can find them. I use a LINK II with my 1040STE and have
never had a problem with any SCSI hard drive that I've used with it.
Those Links are in good small plastic cases.
Originally they came with ICDs hard drive utilities. And its not bad
software to use on 1040STe/MegaSTe/etc. Not knocking HD Driver,
Its good also. Use it on one of my Falcons.

BTW, if you decide not to keep that damaged board. In stead of
throwing it out. Give/sell or trade it to me. I tinker on all kinds of
Atari hardware when I have the time. Don't know if I could fix it
without looking at it. But might could use a chip or something off
of it, if they are not all fried.

My other critical advice for him would be not to use Xmas in July as an
advertisement. It might offend some religous people (I'm a little
dissapointed but not offended) because the primary meaning of Xmas is a
religious celebration, not a means to market merchandise (remember, "Have
you made my Father's house a den of merchandise?")

I realize that many companies do market at Xmas time, however I think "Xmas
in July" sale is taking it too far.

Just some helpful criticism, not a flame.

There's not another Atari user in the whole Rosamond, Calif. area.

It took me amost a year to get this card when I first moved here. Don't know
which chip fried, but a single drop of water did it.

I was lucky my TT didn't fry, as it is the 1040ST keyboard is trashed and
has to be replaced too.

Hi Mark

Floppy boot sectors don't need extra software in order to be able to execute
if they are executable software, they do it all on their own.

Steve, the point he is making is that at reset the MSTe defaults to
8mhz, which then is what youre stuck at. With Booter you can set 16mhz,
then boot the game.

Coda.

Hello,

I made a new bugfixed version:

Emulate Pause key with Alt+P.
Status bar zoomed in big resolutions.
Work with old Shareware versions.
Caches sounds instead of loading them all at start.
Audio can be switched off.
And many more!

The more important fix is being able to switch audio off, which should
prevent most crashed at start.

Aha,

So you are getting the advantages of 64bit. Oh well ;-) It was an idea.

Anyway, definitely no JIT for now, and you'll have to run a 32bit binary
of AraNYM compiled for non-JIT. That's currently the only way I can get
it to work, but unfortunately I run Gentoo instead of Suse so I won't be
able to help too much.

Thanks,
Mark

> LAN converter that works great with Atari computers. I heard about it
> first from the Atari 8-bitters, who were using it both for BBSs and as

Hm! Question for you, then: do you know if there is anyone doing any
work on BBS Express, or is the source released to the public? If it's in
C, it shouldn't be too much of a problem to port over STinGadel's telnet
server code into BBS Express. The only problem then would be to convert
all the single-user code that BBS Express uses to a multi-aware version.

> clients directly. It costs more than the EtherNEC (I have one of those
> too, btw, bought from Rory), so I don't really know which is the better
> way to go. It doesn't tie up a cartridge port, it does have a nice web

There would be pros and cons to both approaches; as you mentioned, not
using an EtherNEC frees up your cartridge port for other ventures.
However, using EtherNEC exploits the power of STinG and the availability
and use of multiply-connected users. (no 'busy singals' as it were :))

> based configuration, etc, etc,.. I never tried the etherNEC, to be honest.
> It just looked like one of those "gizmos" that I would want to have
> someday. I may wind up using it for my Falcon though, until some of
> the newer Falcon projects get completed. <grin>

It's really *really* nice. Opens up the internet to your ST in ways
the original ST's designers would have *never* considered. The only
pity is that the original designers didn't design the cartridge port
as well as it could have been.. For example, the 8-bit xl's expansion
port. Of course, the cart port was only originally intended to be read-
only, but thanks to some very original and imaginative designers
(a la EtherNEC, the cartrdige-to-IDE connectors, etc.), it has become
far more than it was originally designed to be.

Okay, so it basically emulates a modem, complete with the Carrier
Detect, RTS/CTS etc, and is otherwise a fancy interface for a null-modem
serial cable. That's pretty cool.. I wondered how the C-64 telnet-able
bbses were doing their thing.. heh

>> the controller as well. But the drive should never be a problem for an
>> image consisting on 80 tracks.
>
>Not when your using a drive on a ST, its the drive.

No, at least not for images with 80 tracks. Again, a bare drive has no relation to the number of sector or track layout. Saying that a specific drive doesnt support 10 (or 11) sectors per track doesnt make any sense. It would be the same as saying that a drive doesnt support files in Japanese. The drive doesnt know neither cares about the internal layout of a track. The only exception is drives with their own controller as USB drives.

A specific drive might have a limitation on the number of tracks though. Some drives cannot access more than 80 tracks. And most ST drives cannot access more than 82 tracks.

So if you cannot write an ST or MSA image with an ST, its either because it has more than 80 tracks, or the problem is somewhere else (could be the software). The only other possibility is if you are attempting to write an image that doesnt fit in any DD drive at all. For example, you can manually create an image with 15 sectors per tracks and use it under emulators; but obviously you cannot write it back to a physical DD disk.

And of course that you cannot write a double sided image with a single sided drive.

I seem to remember reading somewhere that the Atari cartridge port
was read-only (due to insufficient number of connection lines). Or
has the Paskud Interface overcome this limitation?

As per Starlord, I was told that Rich Sanchez, the last owner, released a final version into the public domain.

I'm no programmer, so what you're describing sounds like a big deal to me <smile>.

I fully agree, pros and cons for both. Bottom line, in a lot of ways to me is that the EtherNEC is cheaper, plus (and a big one) is supported by an actual Atarian. (Rory M.) :-)

Though, to be fair, what few times I contacted Lantronix for help, they were nice, quick, and accurate.

I hear ya! When I shut my BBS down in '98/99 because 3 ISPs showed up in our county (and correspondingly calls dropped off), I was really bummed out. Now, I'm feeling pretty good about my BBS Express! ST running Mega ST again.

See ya! :-)

Hi all,

I have the last 3 upgraded STFM's to clear, Open to resonable offers on
these machines as I need to clear out some space as im very limited!
I am in the UK, I will ship overseas, though you can expect to pay £60 for
cheapest shipping before anyone asks. I can take paypal (with surcharge) or
cash or even cheque, you can collect or pay postage cost.

Anyone wants to contact my direct, just use my name and the website name,
make sure you get my name in the body of the E-mail else it could end up
anywhere or even lost.

http://www.cps-electronics.co.uk/web/clearance.asp

I dont know why, im not saying I do, but some drives will not format anything over normal tracks and sectors. Its a problem which I have seen on many PC's and Ataris, swapping the drive is the only cure. the only drive which I found which was fully upto the job was the MPF920 or in general any sony drive in MPF series. thats why people use them!! I'm sure there are other drives on the market by now which will do the job, though I tested a hell of a lot of drives and only the MPF920 did the FULL job. you may get the odd few tracks or maybe the odd extra sector or 2 out of a generic drive but I have only ever seen the sony drive do this fully. If you can offer a explination as to why a PC and atari will not format a extended floppy on particular drives,then im all ears into hearing a explination.

The PC's I had over the years would laugh at extended drives, drive capable or not, though I wasn't worried about that since I only wanted them for my ST.

> It would be the same as saying that a drive doesnt support files in
> Japanese. The drive doesnt know neither cares about the internal layout of

> drives.
>

If the chips they use don't support 10,11 sectors then the drive aint going to do it, probably cost cutting cheap chips on drives is all it is. most drives will probably go 10 sectors, not may ever got to 11 sectors. if I remember right 1.44s were 18 sectors, most drives will go 20 sectors, almost none will go 22 sectors... I guess its your definition of "extended" I always went for the most extended drives, only found the MPF series to beat all the rest, thats why I used um for years!

> A specific drive might have a limitation on the number of tracks though.
> Some drives cannot access more than 80 tracks. And most ST drives cannot
> access more than 82 tracks.

Some drives can't do more than 80tracks, its the drive, I am aware that most PC controllers wont do it anyway, though on a ST they will. I paid £60 out for a top of the range floppy drive a few years back, anything over normal 1.44 format and it just wouldn't do it, just crap drives. Some drives are pretty good, I think TEAC supported some nice extended formats, not as good as the sony drive tho.

thats something else, you only need to do a basic format to try a drive on a PC or ST. If you have the right drive on a ST then you can write any images. There is nothing worse than having a 800K image and have the drive grunt at you cos it can't do it... change the drive for a better one and all is fine..

>
> And of course that you cannot write a double sided image with a single
> sided drive.
>

ohhhhhh yesssss you can, lol..... ;-)

Actually a lot of my 1.44's are formatted to 22 sectors 83 tracks, I think that gave a nice 1.88 format..... I wonder if you are refering to 720K drives actually, most of them were good for extended formats, the epson drives were very good at even more extended formats, probably the sony 720's aswell.....

2531. eBay occasionally a rip-off? What other sources?

Newsgroup: comp.sys.atari.st
Date: 2005-07-01 22:05:36 UTC
From: techie_alison <techie_alison2000@yahoo.com>
Message-ID: <da4eng$6m2$1@nwrdmz02.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 12708

Hi there,

As I delve deeper into the Atari scene, it all seems to be changing over the last 3-6 months or so on eBay. Perhaps the feeling is that more people are jumping on the lets-sell-something bandwagon.

What's got my attention here is this lot for an Ultimate Ripper from Power Computing for £35!! http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&category=96944&item=5214856682&rd=1 The rom images are freely available on the net, with the 2 socket eprom boards available from 16/32 for £7.50. Admittedly an eprom burner is needed and some simple programming skills to segment up the image for the roms, but £35!! for something that was sold for £17.95 by 1993.

My latest eBay blunder has been an STE bought as 'excellent' which turned out to be cracked right through the case down the left hand side, and the most yellow ST I have out of 4.

I was wondering by asking here what the best sources you think are for Atari ST kit? I'm becoming very wary of eBay as years ago people were friendly, notifications of packages sent were common place. It's like going down to your local buy-rite store now. Still some good kit on there but occasionally waaayyy overpriced and not particularly brilliant customer service. The main offenders seem to be the BIG sellers with thousands of sales, get-em in get-em out. The small sellers still remain excellent and often become good contacts.

Rant over, just interested to see how other people find it and get their kit?

Thanks,

Aly, Cambridge UK

indeed, you have to be carefull, even though its offtopic, but it amazes me
how insurance car right-offs with the front totally mashed in are listed as
"MINT CONDICTION" and going for the price of a new car.... I mean who is
going to buy a car with a crushed engine when they can buy a working one for
the same cash ?!?! me thinks im missing something somewhere.....

> I was wondering by asking here what the best sources you think are for
> Atari
> ST kit?

my website ;-)))) actually I dont sell any kits but the 1.44 controllers
now... my upgrading atari days are at a close, hence me other post about
clearning off STFM's too..... *sigh*

>I'm becoming very wary of eBay as years ago people were friendly,
> notifications of packages sent were common place. It's like going down to
> your local buy-rite store now. Still some good kit on there but
> occasionally waaayyy overpriced and not particularly brilliant customer
> service. The main offenders seem to be the BIG sellers with thousands of

>

oh yes, I brought a fone cable from one such guy, he was WAY in over his head, his sales were in the 10,000's and so were his negative feedbacks... the product was very poor and he even shiped pirate CD's with it and you couldn't even use the cable cos the software was so much out of date...

I've had trouble with new commers to Ebay, mostly ppl trying to con u, they are clueless and nothing ever gets sortout out. One time I listed a item twice by mistake, honest mistake, one guy bid on it and I cancled the auction, he played hell about it going on on how he promissed it to his friend who has paid him for it so he must have it, and if I dont sell it him he would take me to court and demand compensation... it went on for months, he dragged Ebay, paypal anyone he could get in touch with let alone the piles of abusive e-mails I got every hour... also threatend to come over to our house and take the item by force, I mean seesh, where do these people get off, he never even paid for it cos I ended the auction..... its not the first time ive had to deal with people like these either....
Then theres the people who try to fake the paypay payments to you, which drags out over and over.. they all seem very nice etc but fail to understand that im not *that* thick and going to accept a fake payment, then they send it again... and again... and again..... fake fake fake!!! more months of wasted time..... then eventually they get abusive cos you have not sent them the goods and then drag you though ebay and paypal, then back to abuse E-mails.....you have to ask is it really worth the bother in selling stuff.....

I have a few general items on Ebay now, though I dont like to chuck stuff out, its probably going to be a whole lot easier than trying to sell it.... I've even sent stuff to people FOR FREE and they compalin cos the item is faulty (when you said it was) and they want to take you to court cos you have sold them something which is faulty..... they failing to realise they haven't even paid for it..... then its back to abuse..... its never ending..... so really no matter what I have or its value its going in the bin in future.

> Rant over, just interested to see how other people find it and get their
> kit?
>

Very wary of anything form Ebay!! Most ppl (like me) just shout out hear, if you can get past the trolls then you are off to a good start. if you want anything just shout out on the forums, do homework first and see how regular they are, or if anyone known actually knows them..... there are a lot of known regulars in here among other places so its the safest place to start I think!

> Aly, Cambridge UK

When do you think were gonna have some more storms ;-) the last one shook our house the thunder was that LOUD!

Why Why why why? There's already the Pegasos? Why not build something
out of that? It's already completely open, based on this design it looks
like the only lacking part is the PCI-X on the Pegasos. It seems like a
redundant work effort, but if this brings me closer to a powerpc based
Atari clone, so be it :) I want one.

I've done about 20 sales and 60 purchases in total on eBay. Never had a
problem from years ago till now. Bought from all types of sellers big and
small, all types of equipment from high ticket common retail items like an
Apple Powerbook G4 to the rarest of stuff including a Falcon.

It all comes down to making a reasonable assessment of whether or not the
pictures of the items are stock pictures, making a reasonable assessment
of the seller's desire to satisfy customer complaints, and in general
being very careful. If you sell something and someone from Indonesia

with poor English skills sends you an email and asks if he can buy it...
You can almost taste the fraud.

Perhaps I've just gotten lucky, but I discriminate very harshly and do my homework and eBay has never mistreated me. That's the lesson to be learned really, be skeptical of everything and bid and sell very carefully.

The one thing I got semi-screwed on was I bought some BMW software on eBay that the dealerships use. Basically diagnostic/troubleshooting manuals and parts lists. It was only $15 and lo and behold when it arrived it was burned to CD-R. But it was such a professionally done job I decided to let it go ;-) - Besides I had the software that I need that BMW does NOT sell to consumers ;-) And after the price I paid for their car, I figure I should be entitled to it ;-)

eBay has had by far the bottom end prices on all things that I've bought. Compared to other places it can't be beat, that is if you're sure you want something and don't want to return it ;-)

Thanks,
Mark

Mind boggles. Talk about self inflicted stress. I just let the STE thing drop, what's the point in doing that to yourself? Life's too short.

You can't complain about stuff that's FREE, sheeesh!! Off to someone in Cambridge this weekend to pickup some of their Acorn stuff, specifically the mice I'm after as they're bus driven and wayyy better than ST ones (yessss, people, Acorn mice work on ST's ;-)) He's going to get a bottle of wine to say 'thanks'. You can't fcuk up the good will of people within society, it's wrong, it disheartens me to think that people just don't get it. Then they wonder why everyone else is so fed up in the street.

> Very wary of anything form Ebay!! Most ppl (like me) just shout out hear,

True, I can get a great system for around $80-$100
with quite a few carts, but around here, (SE,PA),
there aren't many old Atari systems to be found.

> in 50 years time.

Oh I intend too, I have my Falcon with its CT60..... still n bits I might had... 2 years running I think now.... (in bits that is) A veloce STE from TUS (STE with 68020 CPU and running a bit faster with TOS 206, 1.44 drive (natually)) When I get around to it I will upgrade a STFM for my own use, will make a nice addition to my collection..... I have a ST... needs a very good clean and a PSU! also have a jaguar (no CD tho) with a massive collection of 2 games, plus a 2600 consol with a few games too... I was going to blo a 4MB eprom and add loads of switches to make it selectable, since the games were only like 32K (I think) you could fit a fair few ona 4MB chip..... never got around to that either :-\ no TT..... I do have a Milan 040 in the loft, never got around to seeing if it actually worked... I got it as faulty , though looked like broken simm socket, to which I replaced... but never tested it..... its on my "to do" list tho...

> Ya nods, saying that tho about the 10,000's sellers, some of these ones in
> Hong Kong are quite good, have had a few gems from over there.

Yeah me too, I seem to get my batteries from over there.....

life is very much too short, I'm pretty stressed these days, I try to keep out of things as much as possible now, 9 times out of 10 I try to help someone and all you get back is piles of abuse, this is not limited to the atari groups either... you should see some of the arguments which have happend over the years! its never ending :-(

> You can't complain about stuff that's FREE, sheeesh!! Off to someone in
> Cambridge this weekend to pickup some of their Acorn stuff, specifically

> (yessss,

lol, cool stuff, theres a guy in london who I write too, hes like 70 I think, really nice guy, you should see the stuff he has collected!!! his whole house is piled full of old computers, you name it hes probably got it, hes not online though, been trying to get him to get on the net for years...

hes old and set in his ways ;-) one wonders if a dragon 32 can get on the internet., hmmm.....

> people, Acorn mice work on ST's ;-)) He's going to get a bottle of wine

> they wonder why everyone else is so fed up in the street.

yup, my goodwill just keeps going down and down, but I try not to sink too low, its hard when you get constant attack of abuse from ppl for years and years...there are still good ppl out there, just few and far between these days it seems... most ppl are either ungreatfull or just plain unresonable...

>
>>
>> Very wary of anything form Ebay!! Most ppl (like me) just shout out

Actually, it's well known that Xmas was hijacked from the pagans to aid
in the transistion to christianity. For all we know, Jesus' real
birthday could be in July!

YOu need to install Mint/Mintnet adn then get Cab with the Mintnet Cab.ovl file. I am told the Mintnet ovl file has secure sockets and works great. I cannot test it right at the moment, since my Mintnet partition was loaded with error for some reason and I have to re-install it.

For the 8-bit just get a Commodore monitor cable and a Video converter. Than
get ANY SVGA monitor and it will work. For the ST fet the ST-VGA monitor
adapter and use any SVGA monitor in mono.

Hmmmm.... If you are in CA then you are fairly close
to Best Electronics and B&C, also ATY Computers if Alex still works on
Atari stuff, he would be your best bet at getting it fixed locally.

Heck, I don't know if Best and B&C are still in business or not.
If so, one of them should have either a replacment or something
to get ya going.

Which board is it, I believe they made a few different versions.

Should be stamped on the top side of the board, some are labeled around
the edge of the board

Does it have a on board battery clock?

Phantomm

Strictlyt it is. However there are tricks you can use to write to it. You
have to loose some of the address space, but its possible. Otherwise things
like the Ethernec could not work..

>MS Windows and one of the proved Atari emulators for it.

Why? There are decent emulators in Linux, apart from aranym. StonX,
Steem and Hatari are the ones off the top of my head right now.

> Only about 20 per cent of the programs
>that run with MagiCMac are working. Can I fix this by changing some
>settings?
>Any advice welcome.

Try the emulators I listed above. They might run the programs you
want.

>
>regards Ludwig

P.S. I don't pass judgement easily on people, but you should have been
more patient. A simple post like "Can you please tell me how to run
XXXX and YYYY ... Can you help? " would be better. As anyone who is or
was involved in the creation of an emulator can tell you that it's a
very difficult job. What the aranym people do is very different from
what you want. You want perfect emulation. They don't do that. It's
very easy to flame other people's work. Try the other emulators. If
they don't cover you, you can do the best thing and turn on your Atari
:)

Hi,

> Why Why why why? There's already the Pegasos?

Is this the PPC computer sold as Amiga with a board from bplan?

> Why not build something out of that?

I agree with you in using an existing board is a better way than develop one for such a small market. I had some nice ideas how to build a PPCTOS based on Linux drivers, Aranyms 68k emulator and EmuTOS to make a Atari clone. My idea dont need an underlying OS like aranym. But there is not much time left for such ideas and the last years also not enough money to by a Pegasos.

> final version into the public domain.
>
> I'm no programmer, so what you're describing sounds like a big deal to me
> <smile>.

If you can get a hold of the source code, I'd be happy to look it over
and see what it would take to revamp it towards STinG. I can't promise
any results other than "yeah it can be done," or "sorry, that's just
way too much work". But I'd be glad to oblige a fellow ST sysop!! ;)

Of course, if it's entirely written in assembler, I can already say it's
too much work! If it's in C or maybe GFA Basic, that'd be different..

It's a bit of a drive to get up north to best, if they are still around, I'm down here in the desert. it's an ADSCSI PLUS ST and yes it has the clock battery. My boot system and all formatting was done with the ICD tools. It was a shot in the dark.

Thanks for the suggestion. But unfortunately many popular compilers are not
C99 compliant and don't support <stdint.h>.

I guess I could include it conditionally, but I'm not aware of any predefined
macro for testing the presence of stdint. Not sure is worth anyway. But feel
free to change the typedefs and include it for your own use.

Btw, there are two mistakes in the code. One is just a typo in the comment,
the other is an actual bug but is exposed only in some compilers:

<snip>
***** div68kCycleAccurate.c

// Change this depending on architecture
// This code assumes long is 32 bits and short is 16 bits

***** old\div68kCycleAccurate.c

// Change this depending on architecture
// This code assumes long is 32 bits and short is 32 bits

***** div68kCycleAccurate.c
mcycles = 38;
hdivisor = ((DWORD) divisor) << 16;

for( i = 0; i < 15; i++)
***** old\div68kCycleAccurate.c
mcycles = 38;
hdivisor = divisor << 16;

for( i = 0; i < 15; i++)
*****
<snip>

The missing cast is normally not relevant when the default int size is 32-bits,
that's why I missed it in the PC. But it is usually significant when the
default int size is 16-bits. And for performance reasons 16-bits is the default
int size in many 68000 compilers. For the tests on real 68000 hardware I used
assembler code, so I missed it again.

The corrected version follows:

Jorge
```

```
================================
div68kCycleAccurate.c
================================

/*
* Compute exact number of CPU cycles taken
* by DIVU and DIVS on a 68000 processor.

*/

/*

The routines below take dividend and divisor as parameters.
They return 0 if division by zero, or exact number of cycles otherwise.

The number of cycles returned assumes a register operand.
Effective address time must be added if memory operand.

For 68000 only (not 68010, 68012, 68020, etc).
Probably valid for 68008 after adding the extra prefetch cycle.

Best and worst cases for register operand:
(Note the difference with the documented range.)

DIVU:

Overflow (always): 10 cycles.
Worst case: 136 cycles.
Best case: 76 cycles.

DIVS:

Absolute overflow: 16-18 cycles.
Signed overflow is not detected prematurely.

Worst case: 156 cycles.
Best case without signed overflow: 122 cycles.
Best case with signed overflow: 120 cycles
```

```
*/

// Change this depending on architecture
// This code assumes long is 32 bits and short is 16 bits

typedef unsigned long DWORD;
typedef unsigned short WORD;
typedef signed long LONG;
typedef signed short SHORT;

//

I haven't gone to the Amberley events, infact I only went to a few of the
Corby events, I know they have them in Derby now which is only a few miles
up the road from me, not been to any since Corby though..

>
> The group there would have made a killing selling Telsa coil kits :-)

Maybe, anyone could put together a kit, though its the time involved, plus
cost of parts, it soon adds up to a fair old sum..... Even though most
people dont like the saying, but if they dont have the skill to build one,
then they shouldn't build one!

I think on the 99 corby event the UK record was set, I think they got up to
10feet or something like that, and that thing was LOUD! very good to see
also ;-)

Everyone (well kinda) are getting into the solid state coils now, a lot
harder but gives ppl summert to do I suppose ;-))

It's usually done in 'configure' script:

cat > tmpfile.c <<EOF
#include <stdint.h>
#include <stdlib.h>
#include <stdio.h>
int main(void) {return 0;}
EOF
gcc -c tmpfile.c >/dev/null 2>/dev/null
if test "$?" != "0" ; then
has_stdint="no"
else
has_stdint="yes"

Yes, he actally told me to put it on my homepage thus some French users in a forum could download it. A forum there his friend Emrik (also here at NAS) is at. NAS is the release place for the project.

Rodolphe was here and explained the project for us with mine rgb-canon and laptop at NAS for a hour of time.

The word confidential comes from the time before the release.

The concept relay on Open Software and units that schematics are available for developers and so on. I would not say that this is a ATARI only project, but could be used as that. Its a base for every type of platforms with a "open mind"

Finally, the HD drive works! Even under TOS2.05. I found an old Sony
drive in an old PC.
I did the modifications suggested by Hallvard.
The hardest part was to find the DS0 - DS1 selection circuit.
Anyway - now it works.
Thanks to Hallvard!

Are already formated floppies? If you have a ST with TOS 1.4 or above,
floppies formatted in the ST can be read on a PC. There are programs that will
format floppies in the older Atari's that put a PC sector on the disk.

You're welcome :-)
That's great news!

I suppose you have the same problem as me, where the computer
doesn't automatically detect when to format HD instead of DD.

Strange actually, since the computer obviously can distinguish
between HD and DD floppy disks when reading/writing, so why not
know what kind of disk to format as well?

This depends on the hardware. I'm not sure about the details, but as far as I remember STs/STEs with HD floppy detect the media type (DD/HD) by trying to read, and by changing the FDC clock frequency in case of a read error. So this is a try and error approach that fails when the floppy disk is unformatted, because there will always be a read error. TT/Falcon have "proper" HD floppy disk hardware and do not suffer from this problem.

Do you know if it's possible to modify the hardware so that the
computer already "knows" what kind of floppy is used by reading
the status of the HD-detect switch?

I don't know if this is possible but I doub it, because this is such an
obviously useful modification that somebody would already have done it.

bplan does not exist for many years. Genesi made it. Pegasos is not sold
as Amiga, but it is a clone.

It works on my Falcon with -audio off. The game is much slower then
previous (0.30) versions. On 060 I felt lik playing on 030 and on 030 I
didn't feel like playing at all ;)

Under FreeMiNT (botch Xaaes and Naes) I get black screen (in plannar
mode), but OS seems to be operational becouse it closes cleanly after
CTYL-ALT-DEL.

Check out the Warioware games for the gba. I got Warioware Twisted for
Father's day and its a very cool game. Nice simple games that a breeze
to pick up and play when you have 5-10 minutes to kill.

That's too bad :-(
I just booted my Mega STe to take a look at those parameters in
Ecopy 1.72 (it's from a German magazine several years back. I
think it was "ST computer" but don't quote me on this.
Unfortunately for me, all the menus are in German only, but I get
by though I'd prefer the English version).

Anyway, like I said previously, Ecopy has various settings for HD
and ED (extended density floppy drives: 2.88 Mbytes) modes.
Here's a screenshot: http://home.c2i.net/w-460389/ecopy.gif

It says nothing about machine specific settings except the "TT
kompatibel" setting. Do the other settings make any sense? Are
they indeed just for the TT or Falcon?

I think not just ST/STE but also the TT use the try-and-error approach.

Even if the price was right I would avoid this. Total Feed back 17, Only
six sales, all of old DVD or VHS Tapes. No picture of item. For a "mint
collectors item" I would expect many photos of the original item. I also
don't think the description is correct. If it has a built in floppy drive
then its an STF not a plain "ST". I wonder if its an STFM with modulator as
it comes without monitor or modulator. Also says only 360K (i.e. single
sided disk). This one looks much better item:-

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&category=38597&item=8202057146&rd=1

However as you say plenty of optimists out there:-

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&category=23784&item=7333582437&rd=1

seems a bit of a high starting price. I also like the optimism of

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&category=38597&item=8201622806&rd=1

I would expect the Megafile to have died as its an MFM mechanism. Odd that
the cable has been lost....

Dave.

parcp might help, is also DOS, ST and UNIX based;
http://joy.sophics.cz/parcp/ it's practical and ultra reliable!!

wrote this below, was going to delete it thinking I was getting carried away with myself.. may help.
"
easiest way might be to use PARCP (parallel cable copy) to tranfer the files over. I'm assuming you're talking about getting standard unprotected files over rather than imaging entire disks to .ST or .MSA achives.

have a setup here which connects the PC and ST parallel ports full time. If files need to be transferred, just fire up the server end on the ST, and the client on the PC.

I still don't believe what anyone says about TOS disks being entirely DOS compatiable (not wanting to start a debate war here..), Windoze seems obsessed with wanting to format most of them, usually ok but sometimes screws up the FAT. Also stops you using custom ST formatting programs for 10 sectors etc. ...coverdisks and alike.

Best way again seems to be to use the ST for what it's intended ..reading ST formatted disks. PARCP bridges the gap perfectly, and even runs on Linux too.

Here's the link for parcp; http://joy.sophics.cz/parcp/ . The guy is still contactable via email and accepting shareware registrations. He also sells the custom cables which crossover at pins 1 and 11, with 12 thru 17 NC. Please don't register online, drop him a mail, as I've learnt that the hosting company takes 25% of anything he makes, and even takes VAT too!! Still believe in shareware here when it's well justified.

Hope this helps. I may be wrong and way off here but parallel transfer seems to make fiddling about with disks a long gone nightmare. Can easily download ST stuff from the various ftp sites to the PC, parcp over to the ST ramdisk, and play away. Also have the bulk of my ST disks backed up onto CD for immiediate recovery.

Have been getting into this a bit lately so all still fresh in my mind.

Yep, mailed this guy a few days ago to ask if it included a cubase dongle
with it, version etc. Hasn't replied.. Might be worth it if it was an
original version of cubase, which I suspect it isn't.. Oooh, no mouse. Bit
of a dispute there in the feedback 6 months ago over a mixer, feedback was
left about a month later not after 2 days. Mmmmm. May be an ok seller, but
dubious about him if things got tricky, ...like dongles and disputes.
Would definitely have wanted an answer to that dongle question...

> the cable has been lost....

Mmmm, nods. Those cables aren't exactly easy to come by either. The
external FDD looks good though. The ST looks utterly filthy though.
Monitor looks good, but have 2 of them here (8533's) and they don't seem to
yellow, mono sound-scart. Is Chelmsford, so about 30mins down the road
here, actually might consider that one for the price of a family curry.
Must stop collecting junk though...

Have bought these lately;

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=5210701815&rd=1 (good
mutlisync monitor really, bit yellow, local pickup, seller was most
interesting..)

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=8198438142&rd=1 (was a
local pickup. TOTALLY immaculate and complete right down to the clear
sticky plastic still covering the Atari 520STFM badge next to the FDD light)

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=5205612710&rd=1 (another immaculate find, good contact that guy too)

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=8195234732&rd=1 (biggest heap of junk I've bought so far, 2-3 weeks to deliver, yellow, thought about 'well you only live once' so just summed up, sod it!)

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=8195233369&rd=1 (from the same seller so weighed up what I'd got, can at least backup protected disks)

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=8195233343&rd=1 (An SF314 with a single sided drive fitted in it.....(checked lots of old ST mags adverts that 314 is DSDD) same seller again, had had some good ZX Spectrum stuff off of them in the past :-( )

Right, now must shut up, but they're some goods and bads really. One last question, how do I stop my links up there being broken up over different lines in Outlook? am guessing I'm missing something. Not wanting to drive you nice peeps insane..

night-night

Use a real ST, with MSAII, and link it to your PC thru the serial port,
with Ghostlink (GHOSTLNK.ZIP IIRC).

You'll see your PC drives as ST drives, so the transfer can't be easier.
You'll have time to drink a coffee, though, while the disk is being
copied to the PC.

It depends on what you want to do with the disks.

By transfer, do you just want to copy ST disks to the PC hard drive
and have the programs listed on the harddrive as they were on the
ST Floppy?

Or do you want to use the ST disks in a PC drive for use with
a ST Emulator. And or just to copy files over between systems?

Or are you wanting to transfer ST disks to the PC hard drive into
sometype of Image file that has all the programs and etc of the
ST disk?

There are alot of different software and hardware made over the
years to transfer ST disks or files to the PC.

Which way is best, really depends on what you want to do with
the ST software. And or the ST Disks.
Also, the type of ST software, Original ST programs that may have
protection, ST disks that have just one Program or Game that may
not be listed in a directory normally; ST Disks with applications and
games or utilities and etc that aren't protected and can be listed
normally in a directory.

If you just want to make backup Disk Images, then the above isn't
that important except for disks that have copy protection.

Also some ST software of the Net and on normal ST Disks have
been placed on disks with Menus, especially games.
Most of these types of games have been cracked/hacked and have
non-standard was to load up the games. (The Menu Type).

In my experience, these can be hard to read by a PC drive. It has
something to do with the way the Menu looks to the PC as alot of them
mess with the boot sectors.

If you give us a little more info on what type of ST disk software and
what you want to do with it, then someone or maybe myself can suggest
a good method to handle them.

That's a way to do it. But the great thing about those Mag Pro RGB
monitors is that
you can connect a ST and 8-bit at the same time. Have both machines
running and
just press a button on front to switch between screen displays.
It saves alot of desk space. And it even has a VCR button on back.
And a Green Screen button on front. And plenty of pots on front and back
to
control the color, contrast and etc. It's one of the best ever made in
my opinion.

I never had a manual for it, so I was never quite sure what the VCR
button did, unless
it switched one of the ports to output to hook to a VCR.

Anyone know for sure?

It also works fine on a Atari Falcon in the RGB modes.

Mine went out on me. I can hear the whistle of a bad Cap or two and have
narrowed it
down around the powersupply. It's not shorted as the fuse isn't blown.

So it most likely a bad cap or two with the humming.
It just lost all power at once.

When I have time, I'll check and replace a few Caps. But would mind having
another one or two of these if the price is right.

In the mean time, I am looking for a used one for sale that works.

>computer already "knows" what kind of floppy is used by reading
>the status of the HD-detect switch?

Yes, it is possible, its a simple TTL signal. But it is not very useful,
and probably because of this it was never done.

It is very easy to detect the media type without any trial and error, even
when the disk is virgin unformatted. And it surprising (or not) that TOS
is not smart enough to detect this automatically.

TOS doesn't change the FDC clock. The FDC clock is automatically changed
by the hardware following the HD signal. That's precisely the reason why
it is easy to detect the media type, even without any reading or writing to
the disk.

And btw, because of this same reason, *every* TOS version (including 1.0)
supports HD disks. The only thing that you get with 2.05 and above is
built-in support for formatting HD disks. So you need a third party
formatter in previous TOS versions.

Again, too bad :-(
But since it's simple, *can* it be done?
I would certainly like for the computer to automatically "know"
what kind of disk is inserted.

> TOS doesn't change the FDC clock. The FDC clock is automatically changed
> by the hardware following the HD signal. That's precisely the reason why
> it is easy to detect the media type, even without any reading or writing to
> the disk.

I'm not sure I understand.
Are you saying that the clock (8 or 16 Mhz) of the FDC chip
(WS-1772/AJAX) is changed, based on which position the HD-detect
switch in the floppy drive is at?
I remember messing around with the HD detect switch when I
modified the drive for my STe. I never got around to making the
HD-module though, but ended up using the same modified Sony drive
with my Mega STe, which works fine.
I don't remember the details, but I made a connection from the HD
detect switch to pin 2 of the disk drive connector (34 pin
Shugart connector). I think this had to do with the HD mode. Is
this something that can be used?

> And btw, because of this same reason, *every* TOS version (including 1.0)
> supports HD disks. The only thing that you get with 2.05 and above is

> formatter in previous TOS versions.

In my opinion you need third party formatters in any case if you
want PC compatible disks that don't take forever to do, but
that's beyond the point ;-)

Oh well, if the floppy drive circuitry of the Mega STe can't be
modified to automatically know the disk type to be used I guess I
can set Ecopy to format HD floppies by default as that's what
I'll be using from now on anyway. No more need to hunt down

stores that sell DD floppies that cost twice as much as HD
floppies, but store half -if you can find them at all!

So I've bought the Compact Flash cards and the dosh will be sent off to Paskud later on this week ..

The only sticking point I can see is how am I going to power up the Compact Flash cards (they need small IDE floppy psu cables) .. do I get a cheap and cheerful PC PSU and just use the floppy ports from that or is there a way to cobble together a 3.5" USB h/drive adapter to make it work that way?

It can be done. But you'll need software that is aware of this, otherwise
it's useless.

>Are you saying that the clock (8 or 16 Mhz) of the FDC chip
>(WS-1772/AJAX) is changed, based on which position the HD-detect
>switch in the floppy drive is at?

Yes. But not exactly from the switch itself. From the HD signal at the
Shugart connector.

Hi all,

Yes the ICD site is for information only. They do PC stuff only now.
Its been about 2-3 years since I talked face to face with Tom Harker.
I actually got the last 2 ICD Link II's ever made. I had to do some
serious arm twisting, but drove to Rockford and picked them up.

There were several versions of the ICD host adapters, some custom made
for Hybrid Arts hardware. Some would only recognize smalll hard drives
for the digital recorders. I just had one mysteriously die last week.
I'm going to try and do a parts pull/replace type of repair.

Why open a new service with custom protocols and overhead when there is
already IRC available? One can choose the client to use and it offers
all what one can expect for chatting....and IRC networks tend to be up
all time while a single custom server might be down for some time, esp.
when running over your private cable line ;)

From: jdplace@REMOVESPAMcableone.net
Message-ID: <11ckhts11qphd53@corp.supernews.com>
Source record: 12567

I have accomplished booting from compact flash with my 1040STe. The hardware I am using is as follows:
ICD Link II, Apple CD-ROM, Microtech Digital Photoalbum P, PCMCIA adaptor for compact flash, 64 MB compact flash. The Apple CD-ROM provides termination power for the Link II. I am booting with ICD Pro drivers, although HDdriver may be a better solution. I haven't tried it yet. The one thing I "tweeked" - I set retries to 4 in the driver. This setup is totally silent, and surprisingly fast. Only time will tell how reliable it will be.

This also provides me with a silent 130XE, as I use 800XLDeeJay software on the STe with an SIO2PC cable to serve files and programs to my 130XE.

> previous (0.30) versions. On 060 I felt lik playing on 030 and on 030 I
> didn't feel like playing at all ;)

I know it is slower that previous versions (at least when you don't have
FastRam). Maybe the program flags are not taken into account. In next
version, I will force allocation to FastRam if available.

> Under FreeMiNT (botch Xaaes and Naes) I get black screen (in plannar
> mode), but OS seems to be operational becouse it closes cleanly after
> CTYL-ALT-DEL.

If it is slow, maybe you are not waiting long enough, try to run with:
'-devparm -audio off -warp 1 1' to start first level.

Why should everyone use IRC? I for one do not like it that much, and
cannot connect to IRC from work anyway, whereas Telnet, I can.

Anyway, why cant the man set up his own chat server? Thats like saying
dont bother designing another car, because there are so many good ones
already.

Yup, I'm going to put a Mega STe in a 19" rack enclosure.
It's a little bit too wide to fit the normal way (it's around
60cm wide if I recall correctly), but if I find a very deep
enclosure it'll work fine by placing it sideways, which is what
I'm going to do.

I've asked around, and apparently there's no general limitations
to the 19" standard when it comes to the depth of a unit.

I still haven't found a 19" rack enclosure to fit my specs
though, so who knows -maybe I'll end up building my own.

I have to say, I'm glad he did. I've not been able to connect to atariscne
once from where I'm at, despite numerous attempts at help from others on
this list. I had just about given up directly chatting to fellow Atari
users (other than the 1 to 1 chat on my BBS).

According to Robert Schaffner's faq, the pinouts are the following:

Standard PC power connector : red + 5V
yellow + 12V
black GND
ST, STE, MEGA, MEGASTE, TT : red + 5V
yellow + 12V
black GND

You can simple solder the power cable to the PSU of your atari. (double
check not to mix the cables !!!!!)

Hope this helps.

You could always use a standard open rack frame which will allow a server to protrude in the rear. I can't imagine though that our 1U HP servers are longer than an ST in a rack mount case would be mounted sideways (so ports on the motherboard face left or right side).

Thanks,
Mark

Have you checked the wide of an STFM board. If I remember properly its just
too wide to fit easily in a 19" rack.
Not sure how Barry manages it. His case looks the right price...

Hi
I also have some similar hardware without any manuals or software.

An ADAP Soundrack that plugs into the cartridge port, and a Digital
F/X Digital Master EX system. No leads/cables or software/instructions. Only
just got it and still figuring it out.

Rory, is this the same system you have?

I've found reference to a review in Electronic Musician April '93,
but living in the UK that mag is hard to find.

Any help would be much appreciated.

Mark (II ?)

Mark,

I have two ADAP II's and a Digital Master setup. I may have a Digital Master zip file somebody had sent me some time ago. I am in the process of looking for it.

Apparently the manuals are big and hard to find. i have the connecting pcb to the cart port. It is a straight through ide cable surrounded by copper foil for shielding. It has to be a short run due to buffering i believe. I also think the cable connecting the hardware is a straight through serial cable.

I wont know for sure until I can find the software. Im sure somebody has a working setup of these things...

Rory

Is it just the clock that's changed? ISTR that you also had to
alter the step-rate from 3 to 6 ms for HD disks to counteract the
higher clock-speed (or is it the other way round?). I had an HD
conversion fitted on my old STFM and ISTR it made some strange
noises with the 'wrong' step-rate, and also slow access if left
on 6 ms with DD disks - but it's years ago and though I still have
the machine as a spare I haven't used it for yonks!

Regards, /Peter/

Its the right price, but make sure you get one thats more or less finished, or else you will spend hours/days in the garage with a angle grinder, drill, file etc. The other thing to watch is that there is no way to screw in both sides of the floppy drive AND the cd drive, its one or the other.

Wrong, you just couldn't figure it out.

For Info.

The case is specially made to take the ST and Falcon mobos. There is also a
way to make a Mega STE mobo fit but again you need
basic metalworking skills.

I have a few cases left, email for pics and assembly details.

Cod, before you spout any more c**p send me pics of what you did to my case.

Sweetie Pie, just don't....

2667. H20 Falcon game

Newsgroup: comp.sys.atari.st
Date: 2005-07-07 08:36:56 UTC
From: Piotr Mietniowski <mietniow@uci.agh.edu.pl>
Message-ID: <daipmm$o2l$1@galaxy.uci.agh.edu.pl>
Source record: 12594

Hi all,

Yesterday, I have download new game for falcon.
But I have problem with it. I could launch I have seen title screen I
choose play, enter the name and then I see only black screen, the sound
stop. Does anybody have the similar problem or only on my computer ?

Best regards

Piotr Mietniowski

> has a working setup of these things...

Actually I think there's a better chance of finding other ADAP II
users in *music* related newsgroups. Just because it runs on the
Atari ST platform doesn't mean that everybody who uses it is an
Atari enthusiast.

I run the Notator mailing list (C-Lab/Emagic "Notator SL" and
"Creator SL" MIDI sequencing software), and I dare say most of
the members there don't hang out in any Atari related forums.
They just use Notator as a musical tool which happens to run on
the Atari ST.
By the way, if anyone's interested in joining or checking out the
website, here's the URL: http://www.notator.org

There are several computer-music/synth related newsgroups. I'd
suggest posting to this one first: rec.music.makers.synth

2669. "Lokomotive" Disassembler

Newsgroup: comp.sys.atari.st
Date: 2005-07-07 10:08:57 UTC
From: Pavel Reznicek <pavel.jindrich@tiscali.cz>
Message-ID: <daiv06$i40$1@domitilla.aioe.org>
Source record: 12596

Hi all,

Once, I have had a pretty good (German) disassembler for the ST called
"LOKOMOTIVE".
Then I damaged that program because I didn't know what I'm doing...
maybe while experimenting with a resource editor.
The executable file was named "DETECTIV.PRG". Does somebody know where
can I find it again?

Thank

> Under FreeMiNT (botch Xaaes and Naes) I get black screen (in plannar
> mode), but OS seems to be operational becouse it closes cleanly after
> CTYL-ALT-DEL.

I found the source of the problem: Xaaes does not generate MU_TIMER
events, so I am stuck in a neverending loop (except when you open a menu,
try this!).

What else would you like to know? It's working great, just like a
hard drive, but silent. The Microtech Digital Photoalbum P card
reader is the single slot variety, accepting type II or III pcmcia
cards. It's an external device. I can eventually put a picture on
my website. I was surprised to find that the card reader even
provides termination power to the Link II, so you don't need any
other SCSI devices attached. The reader itself fits in the palm of
your hand, so it would be a great option for carrying your data with
you to try on other systems. I also tested the reader on my Falcon
with HDDriver, and it worked great there as well.

I get the CT63 2 days ago, and there is a big problem :
A short-circuit between the 3.3V and GND planes !
I don't know if it is inside the PCB or external... Maybe the cards must be thrown away or if it will be possible to modify them.
I think it is a PCB manufacturing problem... not a problem from soldering from assembler or design from me.

I cannot give now the new delay to ship the boards.

Unlikely it's you since it's same design as the perfect CT60. And that's
a tough mistake for the assembler to make over and over again (unless they
use robotics).

Sounds nice Joe,

Something I wouldn't mind trying in the future.

Anyway have a question.

I have a SIO2PC adapter board.

Am I reading you correctly that you are using it on your STE with
the 130XE to transfer files?

If so, is only the 800XL DeeJay software needed to do this?

I have a bunch of similar software but not sure I have the
800XL DeeJay software. Can you provide a URL for it?

And is the also a Atari 8-bit software emulator for the STe?
Or am I thinking of another piece of software?

Thanks,
phantomm@bellsouth.net

Yep, thats a good way to do it.

Ya know, I have a ST Disk Library Here with 2 or 3 thousand ST disks
that have ST Software backed up
in the MSA format. Some are in ARC or LZH format. But most are complete
disk Images.

I've went thru some of them and this type of MSA Image Backup does seem
to hold up fairly well.

Alot are games and are labeled. Some are utilities and Doc disks. And
some I have no idea until I
use MSA or similar on them as they aren't labeled.

There are plenty enough for a good 2 or 3 CDs full if I could find the
time to copy the MSA IMAGEs over
to CD. Another project on the waiting list.

I do wish any one with a PC who are usings ST images without sometype of
ST would at least try and
get a 1040STe. Although they can be abit hard to find it seems.

Regarding the ICD Link and Link II.

Sure wish someone could get the rights to remake at least the Link II.

Thats a small nice piece of hardware. And a must for using decent SCSI
drives on 1040STes and etc, unless ya can get something like a Link96
which
I really know nothing about.

Does B&C or Best still have a few of these in stock if anyone knows?

From: Phantom <phantomm@bellsouth.net>
Message-ID: <3pkze.48611$Tt.32972@bignews3.bellsouth.net>
Source record: 12621

Yep

The same monitor was sold under the Phillips name as well.

Ok, Do you only have one type of RCA type video input on the back of
your monitor?

Reason I ask is that mine has one for sound and one for input video
which
will work with an Atari 8-bit.

However, I wasn't sure if the RCA video input was also a OUTPUT when the
VCR button is pressed?

Of course there are also a TTL RGB port and a Lin Port. For monitor
cables.

phantomm

Buy the way, if you are in the USA, is it for sale or trade?
Contact me if so....

The main difference between the LINK96/97 and the ICD Link is that the
LINK96/97 has a SCSI ID (7) of its own. This is required for some hard
disk drives and other devices, which are otherwise not recognized on the
bus.
In order to be compliant to the SCSI standard it is required to have
this ID, and some devices rely on it when they communicate with the host.

I could not get it to run on the CT60. It runs fine in 030 mode,
though. Not a bad game! Kind of a Lemmings-style game, except with
water instead of Lemmings.

Source record: 12626

I get the CT63 2 days ago, and there is a big problem :
A short-circuit between the 3.3V and GND planes !
I don't know if it is inside the PCB or external... Maybe the cards must be thrown away or if it will be possible to modify them.
I think it is a PCB manufacturing problem... not a problem from soldering from assembler or design from me.

I cannot give now the new delay to ship the boards.

Right. Sorry. I was replying on very little sleep.

What OS are you using? I assume you've tried it with clean TOS (booted
with Control held down)? Do you have any hardware modifications (like
SCSI or SDMA patches, or bus speeders)?

```
Here's my solution, it has worked with any version of Window$ I tried
it: Get a program called HDCOPY. It's a DOS program, and it can
happily format and write (nearly) any .ST image you throw at it. I'm
currently using it with my PC running WinXP with virtually NO
problems. Formatting & writing disks with 82 tracks, 10 sectors and 2
sides is not a problem.

Hope this helps

Hello,

3 days ago I get the CT63 from factory and there was a small problem (a short circuit between 3.3V and GND layers because of a VIA that were missing on the new Top layer Gerber file I furnished to factory = some trace modifications for the 2 wires for the CTCM !).
Now it is solved and the first CT63 are running fine with CTCM ...
Shipping will begin next monday.
You will receive a personnal email !
Don't ask me WHEN it will go to you !
But if you are leaving home for hollidays (lucky you are !), tell me the date and I will ship after ... or before !

PS : I'm looking for 10 FLASH memory 8Mbits missing on 10 CT63... If you have a source, let me know
References accepted and supported by flasher software are :
- Fujitsu 29F800BA-70PFTN
- AMD 29F800BB-90EC
- others : contact me.

Regards

> Use a RGB Monitor or TV.

No need. Runs fine here on CT60+accelerated bus. Some display probs in
main menu (arrow flickering) but the game itself is ok. Nice idea actualy.
If it runs with ct60+acc'ed bus, should run fine on plain as well....

2716. Atari Stuff for Sale

Newsgroup: comp.sys.atari.st
Date: 2005-07-09 19:23:01 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <dtVze.36292$ho.21869@bignews6.bellsouth.net>
Source record: 12643

Instead of putting this on E-Bay, I thought I would offer it here first.

Here are some basic rules, I reserve the right not to sell if the
highest offer isn't enough in my opinion. Some of these Items
I have spent alot of money on even though there were used
but like new when I got them.
So, If you bid and don't win. Don't get mad at me.
I just can't give these away with the investment I have in them.
All Disks are Original and like new. All include the manuals.

For the Atari Falcon 030

RainBow MultiMedia II Original Disk and Manual.

A great Falcon MultiMedia program. You can even
Sample Sounds and Music thru the Falcons Mic. Input.
It has a Sprite Studio, Photo Studio, Picture Studio,
SlideShow Studio and even a built in Game.

This is an amazing program and is very Fast,
even on a stock Falcon, due to the language its
programmed in. Uses all of the Falcons Colors.

You can even move the menus and displays around
to your liking. The animated Sprite Studio is one of
the best I have seen.

It will install to a Hard Disk. Works on RGB and VGA/SVGA.

This is a hard to find item and a must for anyone
into Graphics and Audio Sampling on the Falcon030.
By Addiction Software.

RAINBOW version 1.0

Version 2s little brother.

This version came out before version II.
Includes Original Disk and Manual.
Works on RGB and VGA/SVGA.

It has a Picture Studio, Photo Studio.
and etc. by Addiction Software.

If sold, I would like both of the above to go to the
same person. But they don't have to.

ATARI ST

--
The Advanced OCP Art Studio
by RainBird/FireBird

Original Box, Manual, and Disk.
In NEW Condition. only shrink wrap removed
to check that the program works.

This was made for the ST series. However,
I do think it will work on a STE as well.
It has a animated Sprite Designer and a World Map
Creator. There were some games made using this
software. But it isn't a complete game creator.
It has Drawing Tools.
Sprites can be output as data ready to put in other programs.
All designs can be prepared and ported via RS232 in correct format
for 16 or 8 bit target machines.

This is another program that ya don't see every day in this condition.

These are the only 3 items I have to sell for now.
As I go thru my extras I will post them here first.

If something interests you but you want to ask a question just e-mail
me.
These a for sale in the USA, but I will consider overseas offers.

E-mail offers and questions to me at:
phantomm@bellsouth.net

2717. Atari Stuff For Sale Part 2

Newsgroup: comp.sys.atari.st
Date: 2005-07-09 21:31:46 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <XIXze.37065$ho.1747@bignews6.bellsouth.net>
Source record: 12644

Here are a few other Atari Items for sale to highest offer.
I reserve the right not to sell if the highest offer isn't
enough in my opinion. So if you bid and don't win
do not take it personally.

Atari Falcon 030

Original Factory 4meg Memory Board for Atari Falcon 030.
Like new Condition.

-

2 NEW Still in original Package RGB Video Adapters for
Atari Falcon 030. This allows you to connect your Falcon030
to a ST type Monitor.

Both are new in package.
One has the attached Noise Filter for use with a SC1224 monitor,
in its own package with label instructions.

The other does not have the filter, but in most cases it's not needed
anyway. Only if you get noise on your monitor.

I will sell both together or separate to the best offer.

WhiteLine CD Series
The Complete Atari MINT 1998

Original CD and CD Box with label.
The CD isn't labeled, but is original.

This was a Expensive CD

APEX MEDIA ORIGINAL MANUAL AND BOX
(Still in Original Shrink Wrap)

*****NO SOFTWARE!! MANUAL ONLY!!*****

This manual is a must for Apex Media owners.

This manual and original Box is in MINT Condition.
It has never been used at all.

Great for collectors, or someone who needs a manual.
Includes the last minute addendum.

This Black Book with the Apex LOGO is over
230pages. If you are using Apex without the Manual
then your using it crippled. There are walk thru demos,
and detail explanations for all options. Even the
Hidden ones.

The complete software package with manual sold for
well over $150.00. Here is your chance to get a
Brand new Original Manual with the Original BOX!!!.
This is the only extra one I have.
I'll never part with my other one.

Again remember, there is no software with this offer!
Manual and Box only!

Original Atari Falcon030 Manuals
(All are like NEW)

Atari Falcon030 Owners Manual
AtariWorks Users Manual
(The extra Atari Manual for the following software)
Audio Fun Machine
Falcon-D2D Recorder
System Audio Manager (SAM)
Breakout
Landmine

These are the Manuals only! No Software Included!
3 Manuals in all.
Make offer on all 3 manuals

-

TRUEPAINT

Original Manual and Original 3 Disk Software
For the Atari ST, STE, TT, and Falcon030 Computers.

In Like New Condition!

One of the best Paint Programs ever made for the Ataris.
Supports all resolutions on the TT and Falcon030
Supports even TrueColour!
Created by HISOFT so you know its good!

Installs to Hard Drive or setup on Floppy Disks.
Setup program guides you through the process.

Supports a Ton of Graphic Image types such as
JPEG, GIF, TGA, GIF, Degas, Image, IFF and more.

Also, includes an animation format for making animations!

Great for anyone into Graphics!

Make offers or send questions to me at:
phantomm@bellsouth.net

2720. Happy Discovery Cart on Falcon

Newsgroup: comp.sys.atari.st
Date: 2005-07-10 04:04:44 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <k61Ae.45818$qm.3991@bignews5.bellsouth.net>
Source record: 12647

Has anyone tried to use a Happy Discovery Cartridge (The Big One) on a Falcon?

If it will not work, is it due to the software not being compatible or the cartridge port
itself being the problem.

Also, if it doesn't work, has anyone tried using Backwards and setting the Falcon to
STE settings and see if that helps?

Reason I ask, is that I have a important disk that is 1.44 High Density that I would
like to copy if possible. The disk has a important program thats protected but
abit damaged. And I'd like a copy of it, so that I can try to work on the copy and
maybe save the program.

Also, any disk or file editors that anyone could recommened that I try to salvage it
is appreciated.

The file got damaged during a setup program. My High Density Drive at the time
was not up to doing this setup program with copy protection. So after an hour
I removed the disk. The support files are fine, but the main program has been
damaged. The setup program is gone and I'm let with this damaged file.

Although I do have another working version of this file, I would still like to
try and get the bad one fixed if for nothing more than experience.

Can anyone suggest, what I can do to fix the file?
I can copy it to another disk to work on it.

But I would like to get the Happy Discovery Cart working on the Falcon if possible as it
would allow me a 2nd Disk Drive.

Phantomm@bellsouth.net

2721. Spectre GCR Cartridge, manual and software

Newsgroup: comp.sys.atari.st
Date: 2005-07-10 04:18:06 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <Si1Ae.45824$qm.4505@bignews5.bellsouth.net>
Source record: 12648

I have a Spectre GCR Cartridge, original Manual and Software. Plus
around 50
disks of Mac software to use with it.

The GCR cartridge has the Mac 128K Roms and works fine.

Is anyone interested in this package for a possible trade for
Atari STE-Falcon Hardware/Software or for purchase?

This is the last version of the GCR cart that was made.

If interested, contact me with your offer or list of items at:
phantomm@bellsouth.net

2722. For Sale or Trade Expose Manual and Software

Newsgroup: comp.sys.atari.st
Date: 2005-07-10 04:30:30 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <uu1Ae.45826$qm.11958@bignews5.bellsouth.net>
Source record: 12499

I have a extra Expose Digitiser original Manual and original Disk
software if anyone is interested.

This manual and software is for use with the Titan Designs Expose
Digitiser.

This is the Digitiser/Splitter setup Manual and Disk only.
No digitizer or Splitter.
The Disk includes Demos, and a few programs for use with the
Digitiser such as FALCAM, which puts the Video Display from the
Digitiser on the Falcons DeskTop.

I have around 3 of these and will part with one Original Manual and
Original
Disk with software that came with the actual Expose Digitiser and
Splitter.

This is a nice item for collectors, or for someone with ApexMedia.

If anyone is interested, I may trade to Atari STe-Falcon Items or Cash.

If interested send list of items for trade or amount of offer to me at:
phantomm@bellsouth.net

2723. In the market for....

Newsgroup: comp.sys.atari.st
Date: 2005-07-10 04:46:02 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <2J1Ae.45830$qm.9974@bignews5.bellsouth.net>
Source record: 12500

Looking for something like SoundPools DSP hardware for the Falcon030
that allows more inputs and outputs that has better electronics for
D2D/Music Recording.

A number of companies made similar hardware devices
such as Steinberg, Line Audio with the JAM 8, or the FAD.

Something similar to these to connect to a Falcons DSP.

Also looking for the Digital Home Studio with or without the CD.

I have various items to trade or cash if price is right.

Contact me in private e-mail at:
phantomm@bellsouth.net

2724. 4T/FX and D2D Edit

Newsgroup: comp.sys.atari.st
Date: 2005-07-10 05:15:56 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <492Ae.45840$qm.35988@bignews5.bellsouth.net>
Source record: 12501

I have been looking for a program for the Falcon030 called
4T/FX and D2D Edit.

This program is by the same folks that did the Falcon D2D program,
that was supplied on the Original Falcon Disk when one bought a
Falcon new.

It is listed in the Toad Catalog page 43. Its a small ad on the bottom
of the
page in the Version 3.42 Catalog. (Yellow Cover)

Anyway, its a program that I'd really like to get.

If anyone has it and wants to make a deal or trade for it, do contact me
at
phantomm@bellsouth.net

2725. Still in the market for Atari Falcons and etc.

If it works for others on plain Falcons and even works on upgraded Falcons
then I'd wonder if maybe it wasn't corrupted somehow when you downloaded
it? Download it again and see. Wouldn't hurt and you'd rule out another
cause.

Good luck.

What settings did you use? I couldn't get it to run, no matter what I did, on my CT60. It ran fine on 030 mode, though. So I thought it had some odd compatibility issue with the 060.

Also, for previous poster, I'm using a mulisync VGA monitor. As long as I'm running it in standard 030 mode, it runs fine on it, so RGB/TV isn't necessary.

Thanks!

Hey Patrice! It works fine!!! Thanks for this new compilation. Just 3
comments:

- It runs only if I add the '-audio off' parameter. Otherwise it
freezes at the splash screen.
- It is definetly slower than the previous version. Even slower than
pmQuake.
- On exit it generates a bus error and fails to restore the color
palette. (complaining about something like 'SDL Parachuting')

Thanks again for your efforts !

Mint 1.16.1, N.AES 2, NVDI 5, N.Thing
CT60@95MHz, accelerated bus

During gamplay I experienced no errors, only on exit.

I just have had a very short try with pmdoom.
It seems to run on Hades (freeMiNT 1.16.3/XaAES latest CVS version).
At least I can launch it but playing is almost impossible. Deadly
slow.
But as I only tried it very short it can be I've to set a parameter.

Hi

Which TOS version did the Atari ST 1024 use? Thanks. :o)

None. There was no Arari ST 1024.

But, theere was Atari 1040 ST, and it used TOS 1.02 and 1.04 IIRC. You
could also upgrade it on your own to 1.06, 1.62, 2.05 or 2.06.

Just out of curiosity, why do people mistake there being an Atari 1024
ST? Is it because of 1MB memory, or what?

Possible. Atari always "rounded up" numbers... dunno why... anybody got
a clue?

Would anyone be interested in a 4.2 GIG SCSI III 68pin Baracudda Hard
Drive?

I bought a LOT of these and have a few that I don't need.

These are in like new condition. These are 3.5 drives and are great for
D2D recording on
the Falcon, or for use on a TT or other Atari using HD Driver.

If interested, contact me for price. I may let up to 3 of them go.

These are fairly hard to find in like new condition.

If interested contact me at:
phantomm@bellsouth.net

Hi NG

I have found a pleothora of original classic Atari ST Games, that some of you may be interested in:

The hole lot can be yourï¿½s for the symbolic price of 10 usd/eur depending on what you prefer! (excluding shipping).
I only sell the whole lot!

All games come boxed with full documentation and memorabilia! Most of them have never been used.

See picture here: www.msystem.dk/images/AtariGames.jpg

Sincerely
Peter Hjorth Feddersen

To fit TOS to a STFM you need a bit of address decoding to get it to work,
since 206 is larger than TOS 1.4.
Fitting 206 to a STE you just alter a couple of jumper links and bung in
your Eproms.

Chris

One megabyte is 1,048,578 bytes. So the Atari 1040 ST is actually
rounding *down* for the number of bytes. Of course, 1024 kilobytes
is one megabyte, so...

Hello,

For a wiki currently in the works, I need a bit of information about
various TOS versions:

ST: 1.00
MegaSTE: 2.02,2.62
TT: 3.01,3.05,3.06
Falcon: 4.00,4.01,4.03
Medusa/Hades/Milan: any version

For each version, I need date of creation, language/country, gemdos
version and aes version. You can have it with any sysinfo-type
program. Thanks.

You can have a look at the current page there:
http://removers.free.fr/wikipendium/wakka.php?wiki=TOS

I have a extra Atari VIDEOMASTER FALCON Cartridge with the
RGB SPLITTER and Original Software and BOX.

This is the Falcon only version.

The Cartridge and Splitter and Manual is in like new condition.

These are fairly rare now.

This is the only unit that I know of that will record video and Audio at
the
same time and put it all into a playable format.
Comes with a PD player so you can give out your demos.

It will also, take TC Color Images from a Still Image source such as a
VCR, DVD, Video Camera or etc.

The software has great Audio features alone.
The software for the video will allow you to import color stills.

There are several Video, Audio, and picture outputs.

Don't miss this one if you are into Video with Audio on the Falcon!!

Contact me at:
phantomm@bellsouth.net

Patrice,

Great work! This one now works perfectly fine on my 66MHz/25MHz bus CT60 Falcon running Magic 6. I haven't seen it crash yet, which is more than I can say for previous versions. Unfortunately, as many have noted, including you, it's pretty slow compared to older versions. Still very playable, but not as fun. It's about as fast for me as Running was on a stock 030/DSP machine. Both GEM and Full-screen modes work well now.

Yes, the 520ST+ in 1986. It was a 520ST with 1MB of RAM and diskbased
TOS so the machine was at least partially usable.

Hi NG

I have two MEGA STeï¿½s. One with an English TOS 2.06 and one with TOS 2.05 in german.

I want to reprogram the German TOS 2.05 with the english one. Is it legal?

How do I make two separate binary files containing the English TOS2.06, both EE and EO?

I have tried a number of TosDump programs, but they only seem to generate one single *.img file containing both EPROMS (mainly for use in emulatoin programs)!

Any help would be appreciated!

Thanks.

>I have two MEGA STe´s. One with an English TOS 2.06 and one with TOS 2.05 in german.

>I want to reprogram the German TOS 2.05 with the english one. Is it
legal?

????? Why do you even bother to ask? You own both machines!

>How do I make two separate binary files containing the English TOS2.06, both EE and EO?

>I have tried a number of TosDump programs, but they only seem to generate one single *.img file containing both EPROMS (mainly for use in emulatoin programs)!

Either use an eprom programmer to dump each chip seperately, or get a
program off the net that will split the TOSDUMP image into its high and
low counterparts. If you are sending the eproms and code to someone to
burn them, they will probably do this for you anyway.

Theres a TOS ROM site somewhere, I can't remember the URL though it has them
all I think... maybe someone here can point you to it, or you could google
for it...

Do they actually work? What about the PAL issue? Does it work okay here in
the US with the NTSC standard?

Whats Toad retail pricing at these days?

Thanks.

Hi Odd,

The TOS/Mint/Magic bit should really have said TOS or Mint or Magic.
Obviously if an implementation works on more than one then it will
please more people.

I was trying not to restrict the Prize idea to any one OS or method
of implementation.

Good luck with the project and I would be glad to help with testing
if I can.

Source record: 12453

Think I offer my 2 cents as I know about the Expose.

(Mike I e-mailed you several times and got no replies)

If they are PAL then you would need sometype of PAL VCR in order to get video
into the Falcon to digitize. If you wanted to say use a Video Camera,
It would have to be
PAL, unless it would work thru the PAL VCR. And I am not sure if this
would work.

I would think that you would lose Video Quality as you would have to
Transfer PAL into
NTSC. I assume the PAL/NTSC VCR would do this but I do wonder about the
quality.

Another thing I am not clear on, Is both the Splitter and the Main board
both PAL?
Or is it just the Splitter or Main Board?

Now, I am almost sure that I have a fix for the PAL Expos's, which will
turn them into
NTSC units. I have studied the Expos's for along time. And have done
modifications
to mine for better results.

If Mike wants me to turn a PAL Expose into a NTSC one, then I wouldn't
mind doing it.
But these days my time is money and I can't do it for free. And I gave
up giving out my best
discoveries for free after losing blood and sweat to discover them.

I don't mind helping out the Atari scene anyway I can. But the Expose'
is one of those things
that has a strange history. If I was a paranoid person, I'd say that
they were sabotaged.
Especially the NTSC ones. But I think they just didn't know how to make
em work with
NTSC. I do if any one interested. I studied Electronics at the
component level and have
a diploma that I am quite proud of.

I have 2 Expos's that are NTSC. One was converted! I can use any NTSC
video device and digitize in all
glorious Color. The last one I did is a small FLH Demo thats on FTP
chapelie.rma.ac.be/atari/

It's nothing fancy, and I didn't take time to use the digital filters on
it that would clean it up abit.

Next Demos I upload will be in the FLC 256 Color Format. So more Atari
owners can see them.
And, I will upload some VideoMaster stuff as well.

I have CDs full of Video stuff I've done with the Expose and VideoMaster
Falcon.

I have 3 VideoMaster Falcons, thats why I offered up one for sale. To
give someone with
a Falcon a chance to get one of the best Video with Sound digitizers
made for the Falcon.

I wish that more Atari owners would explore the Graphics and Video field
of the Ataris.

Even a STe can do some suprising stuff. With programs like CAD 3D 2.0,
Art and Film Director and
a host of other great animation software.

One of my projects just happens to be a Video Digitizer. My main problem
is that I am better at electronics
than programming. But am slowly learning.

I could use some URLs for GFA with tips and some program examples to
tinker with.

For the Atari ST-Falcon Computers to survive we need programmers.

One reason that the Atari 8-bitters are ahead with stuff like a USB cart
is programmers.

There is no reason that machines like the STE, Falcon and TT can't use
USB.

We really need to push programming. Some one with the time and knowledge
could start a
GFA Basic programming Newsletter that Atari owners could subscribe to.

I tell you now, that if we don't start programming ourselves, we are
going to wake up one day with
nothing new to use and no way to catch-up if the Net changes the way one
connects.

I'll hop off my soap box now.

2778. Help with ST RGB Cables

Newsgroup: comp.sys.atari.st
Date: 2005-07-15 06:33:10 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <xLIBe.71805$Tt.34114@bignews3.bellsouth.net>
Source record: 12455

First thing, I need a few normal STE type cables to connect to RGB type
montors.

If anyone has any for sale/trade, do get in contact with me.

Now, I have a few questions about ST type RGB cables.

I am not sure if these were made but here is what I need.

I need a STE type RGB cable, normal ST connection on one end, on the
other
end I need a round TTL RGB end. These have 8 pins. Where as a normal Lin
RGB ST
Cable has 6.

I do have a few TTL RGB Cables with the proper Round Connection on one
end, but they
have a Serial type end with 8 Pins on the other end.

Where any ST cables made with one end connection round with 6 pins and
the other end
round with 8 pins for connecting into a TTL RGB port?

From the info I have, there doesn't seem to be much difference in the
wire connections.

I need such a cable to connect a STE and or Falcon to a certain type of
Monitor.

If anyone has such a cable for sale or trade, do contact me.

If there is a URL, that shows how to build such a cable, then that would
help also.
But I would rather have the cable already made if possible.

Well if you do not mind Mono, you can buy an adapter that will allow direct hookup to a VGA monitor. For Color I use a piece of hardware called "Video Key" and a video converter. Both work great and allow my STe to be hooked up to a SVGA monitor.

Hi all,

I was just using my falcon when the keyboard stopped working.

It's something on the motherboard because I tested the keyboard on another falcon and it works fine. I tested the connector on the motherboard on the keyboard connector where 5v should be and it's not there. I could not see a fuse or anything near the keyboard connector to check or replace.

Any ideas?
Rory

Flagrant System Error

Hi all,

As an answer to my statement "aranym/AFROS a heap of shit?", Milan Jurik wrote to me personally:

> P.S.: Why should I support people like you? What did you do for Atari?
> Did you develop something interesting ever?
I never realized any support from M. J. because aranym isn't good for anything.
I have bought many Atari programs that do not work with aranym.
I have also made a Database of some older Atari Programs called "COMMENT" with Phoenix that you could download from the ST Computer homepage and created an Atari Bootdisk for x86 PC's with the Caldera DOS, a TOS Image, the TOSBOX Emulator and some essentials.
On the othe other hand his question is a little silly. If I buy some electronics from Siemens or so and become angry when it doesn't work nobody asks what I have done for Siemens.

> P.P.S.: Don't answer, it doesn't matter, all your e-mails to lists and
> newsgroups will be ignored by me forever.
If he had not ignored my emails, he whould have seen my following thread "aranym problem solved" where I have corrected my evaluation of aranym referring the compatibility of aranym with TOS 404. But the problem that there is no useful Atari emulator for Linux remains (except perhaps the game emulator Hatari) and so I must install MS Win 98 on my PC and buy a proved Atari emulator for Windows. Sad.

regards, Ludwig

Oh, I didn't see the check you wrote to Milan. I guess typical
programming consultant time is about $40-$50USD per hour (have to defray
the IRS taxes). Multiply that times oh.. maybe 100 hours? Probably a lot
more honestly. And you owe Milan $5000. Of course there's several other
ARAnyM developers too. But they aren't charging.. it's free.

So when it's not perfect, they're not going to kiss your ass - YOU are
supposed to kiss theirs at least somewhat!

>> P.P.S.: Don't answer, it doesn't matter, all your e-mails to lists and

>

Sad for you. Everyone else can use the advertised features of ARAnyM
pretty well, and they at least understand not to bitch so loudly. Maybe
you're used to buying software but things work differently in the free
world. You have to respect people or they cut off support entirely to
you. Oh well. I say serves you right.

You know, they care about compatibility issues and do solve bug reports one by one - but I can almost guarantee your only hope is to piggyback off off another more caring user's desires. If I was an ARAnyM dev, I would ignore you forever too. Your comments were way way way over the top. Sorry.

And if you read anything at all ever instead of being a lame idiot, you would realize ARAnyM is not an emulator but rather a virtual machine. Almost like Wine. It's made for PROPER MODERN programs. It's just not going to run 10 year old hack shit you throw at it, not unless workarounds and whatnot are implemented. It's NOT a perfect falcon emulator and probably won't be for some time. People snap screenshots of falcon games running on it because it's a pleasant surprise - not an expectation - not yet.

And since it's a falcon emulator, it's even less likely to run the shit that won't even run on a REAL modern atari like a ct60.

Anybody would have been willing to nicely explain things to you, and the docs explain things at least marginally well. Open source projects always have docs that aren't perfect. But when you have such an attitude, you're going to lose. go bother the ASH people.. They can have you.

Fact is you have expectations in a place where you should have none. It's like homeless motherfuckers in philly that get pissed when I give them $0.25 instead of $1. They don't know my situation or how much I can afford to give. They're lucky they got anything at all! And now... They DON'T!

Ok I think I'm done with my rant, and I'm sorry if I offended other friends here.. but this is just my humble opinion.

Mark

Ridiculous calculation. 5000$? The price of
MagicMac was only 250 DM and it worked.
And of course I do not write cheques to people who announce not to read
anything from me.

> So when it's not perfect, they're not going to kiss your ass - YOU are
> supposed to kiss theirs at least somewhat!
For what?

> And if you read anything at all ever instead of being a lame idiot, you
> would realize ARAnyM is not an emulator but rather a virtual machine.
> Almost like Wine. It's made for PROPER MODERN programs.
One year old papyrus X doesn't work with aranym even with NVDI 4 installed
instead of fVDI.

> And since it's a falcon emulator, it's even less likely to run the shit
> that won't even run on a REAL modern atari like a ct60.
The ct60 is no modern atari. Now, it is a part of an old computer that
makes it running at perhaps 1/10 of the speed of a modern computer
for the price of a complete modern computer. Some years ago I mailed Mr.
Czuba some interest for a complete computer with a ct 60 for 999 DM but he
refused. Silly idea to produce accelerators for rare computers that can
only bought second hand.

> But when you have such an
> attitude, you're going to lose. go bother the ASH people.. They can
> have you.
They already have me and never felt bothered or were too polite.

> Fact is you have expectations in a place where you should have none.
Of course I had some expectations about aranym after so much loadspoken
promises.

regards, Ludwig

For their free effort for a good product - do you hear anyone else chiming in complaining? When people start bitching about MagiC everyone else chimes in to say how much it pisses them off too. When I pay good money for an OS I expect it to be perfect. When I get something for free I expect problems - shameful that it's pretty much the exact opposite - not just in the atari world either! (and always exceptions.. No free programs beat Papyrus or Tempus Word, etc. None that run on an Atari anyway)

>> And if you read anything at all ever instead of being a lame idiot, you

I'm pretty sure this is bunk. Maybe it doesn't work with XaAES or something. I don't have Papyrus X so I don't know, but I know older versions work.

>> And since it's a falcon emulator, it's even less likely to run the shit

The CT60 is the MOST modern atari available. How can you say it's not a modern Atari. It's the fastest the ATARI world gets! I mean if you're dreaming about computers that don't actually exist, sure. And the price is about right for a limited run project. We've been through all this before. Rodolphe could charge $500USD for CT60 and people would pay it, but he doesn't.

But you complain about the bolt "duct tape" nature of the CT60, but it's an assload faster than Hades or Milan. With SuperVidel and a PCI bus eventually, no matter how ugly it may look physically, it will be the best available.

>> But when you have such an
>> attitude, you're going to lose. go bother the ASH people.. They can
>> have you.
> They already have me and never felt bothered or were too polite.
>

Well this doesn't make any sense at all.

>> Fact is you have expectations in a place where you should have none.
> Of course I had some expectations about aranym after so much loadspoken
> promises.

They do promise some things that aren't actually true, or maybe are true but with exceptions. Regardless, you have no rational reason to behave like a 12 year old child when you don't understand how to get it working. Fact is most everything they promise does work but not every part of it is simple to get working.

I think I figured you out. You must be the type that uses money to solve all your problems. Dealing with commercial vendors, they're paid to deal with pretty much any bad attitude in order to make you happy. That's akin to being a whore or a prostitute.

Well it's pretty cool you found a group of people who aren't your whores. A group where your money doesn't matter. All you have left is your social skills... or lack thereof.

Anyway, since you're defending your prior words and you've made several additional strikes since your initial comments, I'll no longer be responding to you. You can tell by how little activity your threads get that other people don't like you much either. Oh well.

Mark

Well an easy but improper way would be to solder a wire from another 5V source to it. If you probe the board in that area (+ end of big capacitors) you can find another source. You must have had a short or something adn there must be a fuse or something blown. Rodolphe would know best.

Thanks,
Mark

Hi Rory,

I think it may be the same issue as was discussed in this old thread:

http://groups-beta.google.com/group/comp.sys.atari.st/msg/a1ca52fb18919bec?fwc=1

I have had the same prob you are seeing, and managed to take 5v from
another source. Not 100% sure it was the exact same pin as is described
in the posting that the above URL is pointing to.

Gerhard,

Where in TOS .HYP did you find this? I can't find it in mine. Or
is yours a different version? Mine is 1.70 by Zorro according to
the Info panel.

The listing above is, of course, incomplete since most of the TOSs were available in many language versions. (See for instance the chip numbers listed in the Chips 'n ChipsX Index: 'TOS Versionen').

Of course. PC/M_PC is NOT Atari... And for example: a stock Falcon
can run Apex (or ACe or a lot of apps) at speed, lets call it speed 1,
M_PC does not even run those apps.. define speed now ;)

Hi Rory,

If you take 5v from another source and it makes the keyboard work then it may
be alright to use it like that.

However, If possible I would try to discover what caused the problem as another
part of the Falcon may also be affected by this problem.

If you are not getting power at the pins were the keyboard connects to the motherboard.
It is possible that you have a broken solder joint under one or more of the connecting pins.

You could try carefully moving each pin and see if any seem loose. And if you want to do
a more careful look. Take the case apart and look under the board were the pins are to
see if you have a broken solder joint.

If all seems well then we need to find out where the tracks of these pins goes to next and look
there for trouble.

If you have the case apart or have the proper Falcon diagrams, then we could track them back to the
next component and so on.

However I feel that its probably a broken track or bad solder joint, like what happens with the
Mouse and Joystick ports. The solder joints get worked loose from unplugging the mouse and
joysticks.

If you have done work on your Falcon before and have removed the keyboard a few times. It could
be the same thing.

If you have a soldering Iron and some solder, and the time. I would go over each joint and see if that
fixes the problem. If it doesn't, then thats one thing out of the way.

Generally thats how you fix problems like this, unless you know for sure whats causing it.

You eliminate what could be causing the problem and whats left is
usually the problem that needs fixed.

If you do go for the 5v fix from another source. Just notice if you
have any problems with any programs
when running the machine.

2811. Re: Help with ST RGB Cables

Newsgroup: comp.sys.atari.st
Date: 2005-07-17 01:48:32 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <GMiCe.85382$Tt.13888@bignews3.bellsouth.net>
Source record: 12489

I have Video Key and Monitor Master and the Mouse Master all from the
same company.

With the 1040STe and its Composite Output, I could just use it and the
Stereo Sound Jacks.

But thats not the way I want to go.

I will probably have to make my own Cable, which wouldn't be hard as
both the ST RGB 6 Pin
and the IBM RGB 8 Pin are just about the same. They just use a
different connector.

I would already have done this, but I don't want to use the only ST RGB
Cable that I have.

So if anyone has extra ST RGB cables, or a ST RGB Cable to 8 Pin RGB
contact me
at:

phantomm@bellsouth.net

In the mean time, I'll search a few sources I know of.

Thanks,
Phantom

Yes, And I e-mailed several times. Never got back a invalid address.

>>
>>
>>If they are PAL then you would need sometype of PAL VCR in order to
>>get
>>video
>>into the Falcon to digitize.
> Yup, that helps.

It's about the only way it could work as in the US NTSC is the Standard.

>
> The Aiwa unit works perfectly. It converts the signal digitally, there
> is no "loss" or artifacts.

The Quality I am refering to is the difference in PAL and NTSC.

The Frame Rates are at different speeds.

Most of Europe and the UK have a frame rate of 50HZ the highest
frame rate is around 25 frames per second.

In the USA we use 60 HZ which translates into 30 frames per second.

If anyone has a VideoMaster, it works in both PAL and NTSC.
If you are in the USA press the Function 10 button and see what happens.

The size of the Screen of the program will drop down in size.

Now, APEX MEDIA has a PAL and NTSC option in the Video Section.
It doesn't work on a VGA, but it does on a RGB monitor which gives you
the
best color display options to work in and it will make a difference in
the size
of your Video if you are using PAL or NTSC.

>>
>>Another thing I am not clear on, Is both the Splitter and the Main
>>board
>>both PAL?

>>Or is it just the Splitter or Main Board?
>
> The NTSC splitter accepts NTSC video only unless modified. No big
> deal, it's a pretty straight forward converter.

I think you are wrong here. The NTSC Splitters have a adjustable
NTSC HUE Control on the back of the Splitter. PAL Splitters do not
have this option. My NTSC Splitter does have the Hue Control.
And I have a PAL unit that does not. But I have a fix for this.

If you think I am wrong, check the Expose Digitster manual Page 16.

> The PAL Expose accepts 50Khz RGB video at horizontal 15.75 Hz (it
> seems to have a fairly wide tolerance). This means, as I understand
> it, that you would still need a "PAL" DVD player to record direct to
> the Expose using RGB outputs.

PAL is 50 HZ last time I checked.

The Falcon, Jag and ST's can easily
> output that mode, so capture from them is easy. Since there are no
> schematics available, I would be leery of modifying one as I already
> have an external solution with the dual standard vcr.

Sure they can output that mode or they would not work overseas as
PAL is standard over there. But there is a difference in the Screen Size
which will also effect any video that you digitise. It will be smaller
than
a NTSC unit.

I am not sure how the PAL unit will look on a VGA.

Have ya ever played a ST game on a RGB monitor that needed a
50HZ boot program to put the monitor into 50HZ before the game
could be played. I know some of you out there have. Do you remember
that the screen size of the game dropped down in size over normal
games that don't require the 50Hz boot program? Some overseas games
do this automatically.

> The PAL guys overseas should be able to answer those questions. I
> think they call them SCART cables over there, and would allow most any
> video source to connect to the PAL Expose.

Thats fine for the UK and overseas but SCART isn't a standard here.

> Some of the stuff in this link is old, but it explains how they
> managed to screw up NTSC video years ago.
> http://en.wikipedia.org/wiki/NTSC

I will check out this link and see.

I have a few long talks with Doug Little myself (Programmer of Apex
Media)
Also David of Titan Designs has told me a few things in his own way.

However, Those e-mails will not be released by me. Mostly out of respect
for Doug.

>
> You should have gotten hold of Dave Encil back when. The NTSC units
> were actually modified in Oregon, the guy got back logged and never
> completed a lot of the units Dave tried to distribute.
> I have no interest in converting mine.

Toad Computers wasn't in Oregon. They were the official distrubitor of
the
Expose and there Techs did work on them.

One of the main reasons that the NTSC EXPOSE would not work over
here in the US was simply due to the Power Supply.

The US units did not come with a PowerSupply because UK power supplys
are different. Some folks bought the wrong powersupply hooked it up to
the splitter and blew the splitter and it some cases the main board.

It takes a special type of Powersupply to get a NTSC Expose working.

And there are a few other simple mods one can do to get better results.
>>
>>

>
> Your pretty funny. Above you ask ">Another thing I am not clear on, Is
> both the Splitter and the Main board both PAL? Or is it just the
> Splitter or Main Board?", then you say you have converted one.

I'm glad that I am amusing you.

I was asking you if your Expose Splitters are all PAL and if
all of your Main boards are PAL.

There are differences in both. I don't know where you got your Expose's
at
so you could have a PAL Splitter with a NTSC main board.

>
> I would hope you would know if your offering to modify them for
> people :)

I know which boards are Pal and the ones that are NTSC as for
the Splitters, thats easy, just look on the back for the NTSC HUE
Control

that you must don't have.

>
> The Video Master was pretty fun. It doesn't work with Fast Ram, or on
> the 040 however. So your limited to a 14meg Falcon max, and black and
> white video.

Not really true. The video isn't just Black and white. You have several
Color Scales to chose from. such as Red, Green, Yellow, Red, Sepia,
and the normal Grey Scales and all of these are in 256 color scales.

And you can always inport 256color pictures to form a true 256 color
video if you take the time to do it. Also there is the excellent Audio
ability. Which is 16Bits IIRC. The Video and Audio is grabbed together
and when you play it back, the sound is played right along with the
video.

You can then save these movies out in several formats. There is even
a PD player to give out with your films. And it has some special
features
that you can do to the video thats pretty amazing.

Its the only VideoDigitiser for the Falcon, that will grab Audio or
Music with
the Video at the same time. And if you just want to grab Audio and mess
around with it. There are plenty of options to do lots of things.

With the RGB Splitter you can Grab TrueColor Stills from a VCR or
Camera.

The only funny thing about it, is your lack of knowledge of how to use
it.

It was rumoured that a 256color version was in the works. I know it can
be
done. And thats all I am saying about that.

Hi all,

I ran 5v from another point and the keyboard lit up. However the keyboard is sending keystrokes to the motherboard, but they are not registering to the motherboard. The HD spinup bar will shrink to nothing despite pressing the keyboard. The keyboard is good as it works on another falcon. I think there might something a little more serious. Rodolphe any ideas or should I send the board? 68B50?

Thanks,
Rory

100mhz wont, faster bus will. i will improve IDE acces a LOT, altough prolly not to Hades values.. However, CT60 compile GCC sources faster as Hades, even with MP3 playing in background... faster HDD doesn't help much without the rest, even when dealing with a lot of HDD acces (gcc). There is speed and there is speed :) Hades is, on other hand, faster with GFX display.

> As for the thread, the guy came back and corrected his evaluation.

I know this is a dumb question, so forgive me for asking, but it is
plugged onto the keyboard header correctly, right?

Reason I ask is I made the same mistake myself when I was re-casing my
Falcon in a Wizztronics rack case.

It acted something like you describe.

How did you find out?

Are they connected with the SETI Classic Team Atari?

>>
>Its still there
>
>http://setiathome2.ssl.berkeley.edu/fcgi-bin/fcgi?cmd=team_lookup&name=Team%20At
>ari
>
>Mark

The Classic web site can be accessed here -

Http://seticlassic.ssl.berkeley.edu/

The new BOINC-SETI 16 membered Team Atari web page is at -

http://setiweb.ssl.berkeley.edu/team_display.php?teamid=30472

I fully support the "working together" appeal to join the current Team
Atari i9f moving to BOINC. When I settle down I will.

2822. Re: Help with ST RGB Cables

Newsgroup: comp.sys.atari.st
Date: 2005-07-17 19:54:00 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <iGyCe.94644$ho.31300@bignews6.bellsouth.net>
Source record: 12399

Ok I bought another Magnavox RGB 80 Monitor.

It is like my other one in every detail except that it isn't the PRO version.

If it was it would have Magnavox Professional on the front and a Lin RGB Port on the back.

The lin RGB port is the same port thats on the STs/STe/Mega/etc. You can even use the
Falcon on it.

It does have the place for the port but theres a round plastic cover over it. Yes I took it off.
No Lin Port. I even took the case apart in hopes I could just solder in the port. But there is
no circuitry for it.

But it does have the IBM TTL RGB port which is 8 pins Round port almost exactly like the
ST lin RBG ex cept it has 6 pins.

I was wondering if anyone made a cable that had the lin RGB 6 pin connector on one end and
the 8 pin TTL RGB connector on the other.

If not I want to make my own but I only have one good standard ST RGB cable and I don't want
to hack on it.

This monitor and the one I had that broke down both will work on a Atari 8-bit/Commodore.

You can hook both computers up to this monitor at the same time and switch displays by
pressing a switch on the front under the door. Pretty Cool.

The one I just bought is like new.

My old one is fixable, but I just haven't had time to get to Radio Shack to pick up the
right caps and etc. and theres the time to fix it. I have a 7 years old and until schools back in
my time is limited.

I need some standard ST RGB cables any way. The ones with the Round 6pin connector on
both ends. Or a few cut off a bad ST monitor as you suggested to make a

cable.

Thanks for any help

2824. SCUMMVM and Monkey Island

Newsgroup: comp.sys.atari.st
Date: 2005-07-17 21:39:23 UTC
From: pslegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <42dab3eb.0@entanet>
Source record: 12400

I have been trying to get the SCUMMVM game engine running on my Milan (Mint 1.15.12, NAES)

I have discovered that it by running the command "scummvm moneyega" with the game files in the same folder as scummvm binary then the game will start !

Unfortunately it gives two messages in the game window but never gets any further. I think the next screen is the security check.

Has anyone made any better progress ?

I did discover that if the game is started with the wrong parameter such as "scummvm monkey" then it locks the desktop and ctrl-alt-del is the only cure.

Regards,

Peter

Ya know you are on the border line of calling me something that you
better
not.

And If I am wrong, then correct me on what I am wrong about.

>
> I do happen to have an NTSC Expose and splitter as well. The reason I
> didn't mention it was I got it from another user in this group in
> non-working condition and I didn't want you hounding me for months on
> end to trade it for a Spider Man comic book or something.

Thats low of you Mike. I do have a issue of Superman Year 1942 thats
worth all your Expose's together. But I never hounded you for anything.
And I dam sure never offered you a comic book for anything.

BTW, I have all the e-mail we exchanged archived.
If you need something to refresh your memory.

I use to have respect for you as we have exchanged info many times.
But I don't know, you seemed to have changed at least towards me and I
have done nothing to you.

You were the one who invaded my thread when I put up some Expose
Splitter
Software and Manual up for sale. That's rude to say the least. If you
wanted to
advertise your Exposes, You could have done it in your own thread.

I know where you got the NTSC Expose from but I'm not going to drag him
into this. But I looked at that splitter before you did. But not the
Main board.
And I knew you had this years ago. I do remember asking if you wanted to
sell it. But thats as far as it went.

>
> Point is pretty moot. None of this hardware is manufactured any
> longer. Those that have it know what it can do. There is no need to

> retail was on one and made an offer. They are cool if you are hard
> core Atari, but if you really want to do video on a computer, it isn't
> the hot setup.

Hey you jumped me, I just set the record straight.
Moot as in Debatable? Hell we can debate it till hell freezes over.
But Facts are Facts.

And if there is no interest in the Expose, why do you keep poping up
everynow and then announcing that you have a couple then disappear.
I've not seen you contrubute in this group for along time, only when one
mentions the Expose.

And like I said before, you jumped into my thread were I had posted
the Digitiser manual and software for sale.

If I had a discussion going about the Expose, that would have been
different.

As for the Toad Catalog. Maybe they didn't have one. I have
several. I knew the price. Here it is in case anyone is interested.

In the Ten Years of Tos Issue 1985 to 1995 Toad had a 2 page
layout on the Expose and Apex Media. Pages 14 and 15.

The Expose Digitiser was priced $399.00
And Bundled with Apex Media it was $548.00

Actually not a bad price at $399.00 US for what it does if you get
a NTSC version that works.

But I bet Mike will not sell ya one for $399.00 US.

If you have a PAL version, then you will have to figure in the cost for
a PAL/NTSC VCR. Also you need the right power supply or you will blow er
up.

But I doubt that mike really wants to sell. If he did why make someone
look in
a old magazine for the price? Lame stuff.

And I doubt that he has 3 Pal Exposes. Unless he got them from David or
from
someone overseas.
Pal Units were not sent here to be sold. I bought my NTSC expose From
Toad.
And thats were the NTSC one he has came from. They were non working at
the
time and toad was going out of business. Me and the other guy lucked
into them.

My other Pal version came from overseas from a nice guy.

BTW, any other nice guys overseas that have a Expose or ScreenEye for sale, working or not working. Contact me.

If I could get enough of them, I wouldn't mind offering some up to Falcon owners
as I would like to see more Falcon owners have these and do some Video stuff with them.

I happen to collect all things Video Atari as its a hobby of mine.

My best advice for any US Falcon owner wanting to get into Video. Is get the
VideoMaster Falcon Cartridge. The Falcon only version. And if you can spring
for the Splitter, get it so that you can do TrueColor Still Grabs from a VCR or Camera.

I have 3 of them. Plus the ST/STe/Falcon one. I would not have 4 if they were not
good.

The software uses the Falcons own Sound System to grab Audio in 16bits.

14megs is plently of room to do lots of Video with Audio Grabs. Since the Video
is about 1/4 screen size this helps with the memory. And with the special PD display
software you can make that 1/4 Screen Size into a full Screen and there are other
cool effects like Pic in Pic. video running in 4 corners and etc. and is very easy to
use. It's basically just something like a batch file and you select a number or letter
for the effect you want and save it. It can be edited with any text editor.
Also, there was a guy who made a program that did this for you. All you had to do
was choose the effect you wanted and the program would make the control file.
I have the program here. It makes it a bit easier.

The VideoMaster Software is very Cool. There is a ton of stuff you can do.
To much to list here.

There is also a VideoMaster ST/STE/Falcon version of the cart. I have one of
these. Its good for a ST/STE and has the Audio hardware built into the cart so
that you can grab Video with Audio just like on the Falcon. Only its 8bits instead

of 16bits to save memory. But it does a fairly good job and you can
capture Color
stills with a RGB splitter or the included 3 color films. The Falcon
version has the
color films also. But the splitter is much easier to grab color still
with.

This version does work on the Falcon as well, But its really not as good
as the
Falcon only version. Although it does have some interesting software for
the Falcon.
That the Falcon only version does not have.
But for the Falcon, the Falcon only version is the way to go.

To some Atari owners doing Video on their machines is cool and keeps
them
keeping on. Alot of PC graphic software is almost exact copies of
Atari stuff
It's just looks different and with a few more options.

I have found nothing on the PC that is as good as some of the graphic
software
that I run on the Falcon. Even doing a simple slide show on a PC is a
chore.
And unless you have used Ataris first, you have no idea where your files
are on
a PC. Ataris are much better at file managment. Nothing gets lost. And
seldom
does one have to use a program to search for a lost file. You know
whereit is on
a Atari.

The only reason I have a NoteBook is to look at whats being stolen from
Computers
like Atari and Amiga. XP is like Geneva and NeoDesk in alot of ways.
And I've
notice similar features with other Atari/Amiga programs.

And also to see whats coming up next. I don't care much for Windoze but
XP is
closer to using an Atari than any version they have had so far. IMO.

Theres a old saying... Keep your Friends Close, But keep your Enemies
even closer.

> Unfortunately, I won't go on either as I have forgotten more than you
> know about the subject.
>

Well, if you mean that, then I'll take it as a complement. As I try to
stay ontop of
the Atari things that interests me. But I'm not a expert on everything
and I do

make mistakes.

The scummvm port is probably more complicated and probably needs source changes. I know for somewhat FB driven systems, you need to forcefully set SDL full screen and some other stuff.

I'm trying to port ARAnyM to PXA270 ARM and Qtopia.. what a hassle ;-)

Thanks,
Mark

I think you are changing the subject, SWE was talking about the actual machines, not their users.

>BTW: CT60 is also _NOT_ Atari!

Correct, it is an accelerator for an Atari. With the CT60 installed and running at full speed, you will have the fastest Atari hardware (including the TT-clones Medusa and Hades) available today.

Maybe it is possible to get any of the existing emulators to run even faster though, I would not know for sure. But that is clearly a different question.

And I have to say, after booting up with the CD image of ARAnyM, and using
both STeem and Hatari, that they are nice, they bring back a feeling of
nostalgia, and yet...they're not the same as using my Falcon or my Mega ST.

IMHO.

Aranym on the appropriate PC is clearly faster in almost all respects
except RAW speed. JIT for instance can make ARAnyM whip a CT60 on things
like compression, encoding, decoding, encryption, playing movies, etc.

But on things that don't JIT cache well like compiling, there's NO
substitute to a CT60. (or a cross compiler ;-))

Thanks,
Mark

Sounds like Svideo if its 6pin ? The Atari pinouts are in the back of the book and you can look up Svideo on the net, just wire the Composite from the ST to the Svideo input on the monitor, thats how I connected my ST to my PC's graphics card Svideo input connector, its only 2 wires.

You burnt with a short circuit the internal trace from the L83 filter to the keyboard connector pin#4...

Here is the schematics :

+5V ---> L83 ----> Keyboard connector.

Just check if you get +5V on L83. (the middle pin is gnd !)
If yes, connect a good wire or a queue of a resistor between pin of L83 and pin#4 of keyb. conn.
You need only 1cm !
That's all !

Warning : this trace burnt here because it cannot burnt anywhere else ! It burn where it is the most easy to burn !!!
This mean that : if the trace is replaced by this stronger way (resistor queue or big wire), and if you do again a short-circuit, it will burnt somewhere else and maybe not at a good place...!

I have here a board from an italian guy :
It burnt inside the PCB between +12V and gnd...and the copper was fusionned and liquiefied inside the internal layer and touch now the +5v layer and some bus trace !
The PCB is dead !!! No way to repair that !!
The falcon mb is dead and just used for parts...

Regards

I tried "scummvm -e null -g normal -f monkey" and I get a blackscreen.
CTRL-ALT-DEL does not work, so a hard reset is required.
This is with the binary that is from your website.
Have you patched the official sources, and if so are the patch files
available?

Coda.

A quite old one. I don't have a working C++ cross-compiler, so maybe
someone could compile a more recent version using a ct60.

I don't understand the logic of saying that once you plug something into
the expansion port of the Falcon, its no longer a Falcon. Thats what the
expansion port is for; expansion.

Going by that logic, if you plugged an Expose card (or anything else)
into the expansion port, its no longer a Falcon either.

Doesn't make sense from where I'm standing... :-)

>BTW: 3,6 GHz P4 or 2,7 GHz G5 are actual machines!

Yes I cannot recall anyone objecting to that fact. Whether or not you wish to refer to such a machine as an "Atari" depends on if you are talking about compatible hardware or emulated/virtual hardware. The claim that Falcon+CT60 is the fastest Atari was for sure meant for saying that it is the fastest hardware available that was designed to run Atari software. Let's not misunderstand things on purpose.

>but it's as well an anachronism as a 286-MoBo with a K6-III 550MHz AT-

Message-ID: <1121703998.794472.173390@g14g2000cwa.googlegroups.com>
Source record: 12421

Hello everyone,

I've run into an unexpected problem on my CT60 Falcon.

Occasionally on my stock Falcon (with NVDI 4) the Times and Triumverant (I know I'm misspelling the latter) fonts would have some strange behavior, but a quick "quit and restart" would solve the problem. On my CT60 Falcon (with NVDI 5) however, these two fonts place all characters over each other, making for an unreadable dark splotch. Other fonts look fine, and the program otherwise works normally. Does anyone have a solution, or at the very least a freeware substitute to these pesky CS fonts?

Galen

2845. CT60 SCSI issues

Patrice,

I am using the binary version from your website.

Coda, try using "monkeyega" instead of "monkey" if you are using the
ST version of the game like I am. I suspect the ST version is
the 16 colour version.

The two messages that appear are from the game itself, something like
"Before we start..." "Please wait..." I don't have my ST here to
run it.

Peter

I've just tried running it again using the command:

scummvm -p/d/games/monkey -enull MONKEYEGA

Looking for monkeyega
Trying to start game 'Monkey Island 1 (EGA)'
Fatal signal: Bus Error (SDL Parachute Deployed)

It dislayed 1 screen that said "Wait..." in the style of the game graphics.
So I think the game is starting.

And now you easily play emulators on the PSP with the KXploit tool. I have a NES emulator (NesterJ) on my PSP (has the 1.50 BIOS) with a sh**load of games, including some Famicom Disk System games (you need to have the Famicom Disk System BIOS, and it has to be named disksys.rom).

Now if someone would just develop an Atari 2600 emulator for the PSP (or a combo 2600/7800 emulator for the PSP).

Fidel-Sebastian Hunrichse-Lara wrote:

> Define a Atari-system... & I show you whre you're wrong!

I will define it using an comparision: Hyundai is in every respect (speed, safety, bla bla) better as WV Beetle (which, like atari, has big base of fans), yet noone claims that hyndai with WV sticker is WV. Also, how many Hyundai, Fiats etc u can see on WV beetle shows, or how many of those drivers claims they drive a Beetle? So defining Atari system is fairly easy: Made by Atari. CT60 is indeed diskutable, but on other hand, all of the falcon subsystems still are operational, which we can not say for Aranym or MagicPC.

Note: i am strictly discussing what is an Atari and what is not. I do not debate what/which system is better and of some emulator or compatible users feel ofended, that's probably because they feel they that way, maybe ashamed a little ;). But saying that TT/Falcon ARE Atari's and Milan/Aranym are NUT Ataris, is NOT saying Milan/etc is crap or bad. Its just a fact. U can carry 4 persons, using same fuel, same tyres etc on any car, only one is Beetle. Why emulator/compatibles users feel ofended by that, is not for me to resolve. Probably a job for physiatrics...

> longer Atari-systems? No? See what I mean?

Nope. As i described it was an example. U can as well take any game that runs on ST or Falcon, DMA sound app etc, point is that CT60 (which is only CPU accelerator, all the original Falcon subsystems are still functional, and for example, few days ago i played Stardust on CT60) is fastest Atari machine. Magic_PC is faster, but lack shifter/videl compatibility. Aranym offers that as well, but at dramatic speed reduction etc.. And both, Aranym and MagicXX are not Ataris :) Fast or not fast :) Its like old saying: "its important to participate, not win". Of course, only loosers say that :) And Atari is not just OS and selected (GEM only) apps. Atari is whole package, soft and hardware, with all good and bad sides in one package.

Earlier today I tried running the windos version of SCUMMVM using
the Atari data files and it runs fine with monkeyega. It even bypassed the
security screen.

The DOS console window did report that the files were unrecognised
but they must be ok.

Could the Milan xbios be causing a problem ?

2861. Re: CT60 SCSI issues

Newsgroup: comp.sys.atari.st
Date: 2005-07-20 02:17:11 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <ttiDe.11399$xn.2043@bignews6.bellsouth.net>
Source record: 12438

Hi Galen,

I'm not a CT60 owner yet, but I do have A CT2B and I did have issues with the SCSI port.
It turned out that the version of HD Driver I was using was abit old. I simply started using
Cecile thats included in the Flash and all my SCSI problems were gone.

My symptoms were like the SCSI drives were being accessed to fast and were not setting up
with the rest of the system. Same thing on the CDrom and CDR drive.

I have a newer version of HD Driver now, but I've not tried it on the CT2B to see if it works
correctly or not. But I think that it would. IIRC, Uwe changed some things in HD Driver regarding
the Falcons SCSI system.

Do you still have the problems when you switch back to normal 030 mode?

IIRC, I had problems even when I switched back to the stock CPU.

If you are using a older version of HD Driver, that may be the problem.
But I can't recall what version I was using. Except that it was 7 something.
But that has been at least 2 years ago. So it was probably a very early version
7.xx.

Other things that will affect SCSI drives are Termination. Also I have found that
some Falcons like the CD-Rom/CDRW drives at the end of the chain.
Remember that some CD drives have terminator resistors. Some have a simple
jumper that you can remove to enable or disable termination on the drive.

I have seen some where you have to pull out the resistors. They are usually long and in
two sets with pull tabs on them. They are in a single line socket, set of two.
Most of these I have seen are the internal type of CDROM/CDRW that you get and install yourself.

Extra long cables can also be a problem. Although I am using at least a 6 foot SCSI cable from
my CT2B Falcon to the Case were my drives are in. It works fine, but I

still want to get some
shorter SCSI cables.

Hope this helps in some way.

There have not been any issues for a long time, so I would expect it to
work (with HDDRIVER 8.1), indeed.

Hi Patrice,

Would a recompile of the old SCUMMVM with a new SDL be any better ?

It looks like he graphics might work but the sounds may be causing
problems. I have never got the sound working with PM-Doom either
so is this only an SDL issue ?

You're the expert on the compilers. Aren't some people using GCC 3.x ?

I'd really love to be able to play adventure games on my Milan. I miss
not being able to play them.

I will try a few other games and also try the -e pcspk option to see if
that works any better.

Regards,

Peter

CT60 works with HD Driver 7.60 and superior.
It cannot work correctly with <7.60 !

Sure the 8.1x is better, especially the last 8.12 or 13 (I do not remember)...

On 8.xx, I heart the SCSI processor must be disable...I do not know if it stills exact with 8.1x ...

But you have to understand that the software is not all and the hardware must be OK : if you have some lost of data because of a bad clock sync on SDMA, the driver will never fix that !

Aren't emulators as well designed to run Atari software?

> If you added a K6-III upgrade to a 286 motherboard, you would still
> consider it to be a PC I presume....?

Sure! A PC with AMD K6-III-Upgradeboard... but 286 motherboards
normaly use Intel-CPUs & Ataris use MC68000 or MC68030 - everything
else is a form of upgrade.

There's finaly no difference between CT60, compatible hardware or
emulated/virtual hardware... they're all Atari-upgrade-varieties!

You can upgrade a Mega ST or Mega STe which use 68000s to 68030s, so do you think these are still Atari machines? They are both Motorola CPUs.

Furthering that point, the CT60 uses a *Motorola* 68060 chip. So..ergo, if you upgrade a Mega to a 680030, and its still an Atari, then a Falcon with a 68060 is still an Atari. :-)

> There's finaly no difference between CT60, compatible hardware or

Thats your opinion, and you're entitled to it of course. Just don't act surprised when people disagree with you.

I do not think that Atari OS/hardware "emulated" on a different machine architecture is the same as an Atari OS running on Atari hardware.

Please note that I'm *not* saying that emulation is bad, I just don't think its the same.

Personally, I'm impressed as can be with ARAnyM, I think its an incredible effort. I even downloaded the stand-alone ISO, burnt it to CD and can now boot up to an emulated Atari environment on my Dell/Linux laptop. Impressess the heck out of me everytime I do it. :-)

As good as it is, and there's no doubt its getting better, all I have to do is turn my head and look at the machine setting next to it. A real Atari OS running on real Atari hardware. There's no doubt, IMHO, which is which.

Just my 2 cents worth. ;-)

If you look in the text I wrote earlier I said "fastest hardware
available that was designed to run Atari software". The emulator is
designed to run Atari software yes, but the *hardware* that the
emulator is ran on is not. Hence why it is true that a Falcon with a
CT60 is the fastest *Atari hardware setup* available, when we are
talking about the Atari compatible hardware. Ok?

>>There's finaly no difference between CT60, compatible hardware or

Just typed "sony_144.zip" into Google?

2nd one down, on the Atari Hardware Hack Page.
http://atari4ever.free.fr/hardware/drives.html Is for an MPF-520 anyhow, not the current 920's.

I'd be tempted to suggest that you pick up an already modded one from Chris at CPS;
http://www.cps-electronics.co.uk/144/HD4.htm .
At £15 is good value for money seeing as the price on the street is £10 for a stock Sony FDD. Also, should you end up with revision
or something, the likes of PC World and most computer shops wouldn't have a clue what you're talking about, neither would they care
or refund the unit if unmoddable. Have been here before on this one, the stuff on the high street is mass produced cr@p. Current
PC FDD's are not industry standard Shugart drives in the traditional sense.

Another direction to take would be to research into how people with Yamaha music keyboards and alike do it, there's quite a bit of
info out there in other arenas. The problem again, getting hold of the drives to do the mods on. Grab one from CPS.

Did Atari ever build MC68060 machines? AFAIK they only manufacture
some MC68040 prototypes...

> Just don't act surprised when people disagree with you.

I'm not surprised, everywhere exist fundamentalist...

> I do not think that Atari OS/hardware "emulated" on a different machine
> architecture is the same as an Atari OS running on Atari hardware.

Is the CT60 not as well a different machine architecture? And do you
really use an original Atari OS? IMHO only the TOS/GEM software makes
the difference... & not the hardware!

> boot up to an emulated Atari environment on my Dell/Linux laptop.

I favor 68k-Macs - fast enough & old enough... that's pure nostalgia!

Hey gang, I have a question...will the Sony drive in question here match up with the STs drive face?

I guess I'm asking if you have to hack 'n mod the drive opening to accomodate the drive itself.

I wouldn't mind eventually having a 1.44 drive in my Mega ST but I sure wouldn't want to mess up its looks.

Thanks.

Hmm...if I'm reading this right though, you could leave the internal drive
the same and just have an external 1.44? That would work for me. :-)

Right. Different CPU, with a "daughterboard" added.

> Did Atari ever build MC68060 machines? AFAIK they only manufacture
> some MC68040 prototypes...

In effect, you're trying to say that if Atari didn't manufacture it themselves, and you add it to any Atari machine, that its no longer an Atari Machine? That is some really, really odd thinking there friend.

So what about all those 3rd party add-ons over the years? Seems to me, by your reckoning, there are no "true" Atari machines left... :-)

>> Just don't act surprised when people disagree with you.
>
> I'm not surprised, everywhere exist fundamentalist...

Ever notice how many people are agreeing with you vs how many people are not agreeing with you? You might want to think about that...

> Is the CT60 not as well a different machine architecture? And do you
> really use an original Atari OS? IMHO only the TOS/GEM software makes
> the difference... & not the hardware!

No. I've added something to an existing Atari setup. Not removed the entire Atari setup altogether and replaced it. Added...enhanced...not replaced. See?

When I boot up my CT60 Falcon, I wind up at a TOS 4.04 desktop. Do you disagree? I don't have to run another OS, or another program, to get there.

So in effect what I get is this:

"> Sure! A updated Atari machine..."

via this: "Right. Different CPU, with a "daughterboard" added."

No different in concept than the Mega ST/STe running a 678030. See? :-)

>> boot up to an emulated Atari environment on my Dell/Linux laptop.
>

> I favor 68k-Macs - fast enough & old enough... that's pure nostalgia!

Not as good a feeling as booting up an 800XL, IMO... ;-)

yup, theres only the drive select which changes for internal/external. Most
people tend to use thier old 720K external with 1.44 internal, but theres no
problem about doing it the other way around.

Do you think a fundamentalist will agree another fundamentalist?

> No. I've added something to an existing Atari setup.

And is the CT60-Upgradeboard not a different machine architecture?

> Not removed the entire Atari setup altogether and replaced it.

An Atari-emulator that remove the entire Atari setup is no longer a
Atari-emulator, isn't? ;->

2900. Full text of 11 classic flight simulation books on the web

Newsgroup: comp.sys.atari.st
Date: 2005-07-22 05:11:45 UTC
From: Kevin Savetz <savetz-remove@gmail.com>
Message-ID: <savetz-remove-89E26F.22114521072005@news.west.cox.net>
Source record: 12379
Cross-posted to: comp.sys.atari.8bit,comp.sys.cbm,comp.sys.ibm.pc.games.flight-sim,comp.sys.mac.games.flight-sim,comp.sys.amiga,comp.sys.apple2,comp.sys.ibm.pc.classic,comp.sys.atari.st

FlightSimBooks.com is a new site that features the full text of eleven classic flight simulation books.

http://www.FlightSimBooks.com

More than 2,200 printed pages have been digitized into 800+ web pages. The titles available are:

- Jet Fighter School and Jet Fighter School II by Richard G. Sheffield

- Flying on Instruments with Flight Simulator by Jonathan M. Stern

- Learning to Fly with Flight Simulator and Realistic Commercial Flying with Flight Simulator by John Rafferty

- 40 Great Flight Simulator Adventures, 40 More Great Flight Simulator Adventures, Flight Simulator Co-Pilot, Flying Flight Simulator, Runway USA, and A Flight Simulator Odyssey by Charles Gulick

These books, published from 1985-1989, cover Microsoft Flight Simulator and Sublogic Flight Simulator software, plus other flight sim programs including F-15 Strike Eagle and Sublogic's Jet. Users who prefer more modern flight simulators will find that many of the techniques and situations described in these books, such as aerobatic maneuvers and instrument flying techniques, remain relevant to newer flight simulators.

All of the books are available with the gracious permission of their authors.

FlightSimBooks.com was created by Kevin Savetz with help from volunteers. His other classic computing sites include AtariArchives.org, which offers the full text of 30 classic computing books; and Classic Computer Magazine Archive (www.atarimagazines.com), which offers full text of Compute!, Creative Computing, Antic, and other early computer magazines.

Enjoy!
Kevin

Well Mac and Amiga also uses same CPU and they are not Ataris. But i agree with you here, would just expand that: If one replace CPU with more powerfull CPU, and machine use the rest of hardware as it did before (kinda like tunning the car's engine) thats basicaly same machine. Using emulation and similar is not. Best example is new WV beetle. NONE of old fans accept is as real VW beetle, its just WV Golf with fancy look.

> I do not think that Atari OS/hardware "emulated" on a different machine

> think its the same.

Iys definately not the same. WHY emulation users defends themselves (as we didnt say using emu (good one) or compatible is bad) is beyond me. That fact alone, proves, that using original HW is DIFFERENT :)))

CT60 is CPU upgrade: ALL Falcon systems (bus, videl, etc) are still in
use, same as u tune engine of the car....

>> Just don't act surprised when people disagree with you.
>
> I'm not surprised, everywhere exist fundamentalist...

This is stupid. U use a PC, with Windows and run Magic PC then. Let me ask
you this: how come, that your "ATARI" will be brought down by a PC virus?
My Atari surely will not be knocked down by PC/MAC/Linux attack.

The *Falcon* (or any other Atari computer or hardware clone) is clearly a hardware design that is created for the purpose of running Atari software. It is pretty simple.

Why are you still misunderstanding what it said on purpose? Having opinions is one thing, but if you can't even carry on a normal conversation then it is pointless to reply to you anymore.

Good bye.

> and BTW, what country are you from, if you don't mind my asking?

My eMail-adress (*@b.maus.de) should reply your question...

> I'd like to construct an obviously political .sig to reflect poorly on
> the leader(s) of your country

I live now in Germany (in the middle of old Europe) but I was born in
Chile - I've to leave it after 9.11 1973, any other inquiry?

Saluti-gerulus

2910. Atari ST 72-pin SIMM 4Mb Memory Upgrade Procedures

Newsgroup: comp.sys.atari.st
Date: 2005-07-22 18:19:07 UTC
From: techie_alison <techie_alison2000@yahoo.com>
Message-ID: <dbrdaq$ff0$1@nwrdmz01.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 12385

Hi All,

These procedures have been developed over the previous few months with kind assistance of Chris Swinson (Exxos). This is the first
posting of these here before they go off onto the forums etc. so that they can be found by other Atari users when web searching for
such an upgrade (lots of peeps seem to talk about 4Mb upgrades but no one ever says how, strange that...). It's hoped that any
questions or bugs can be addressed and ironed out here with you (the hardcore techies) before it goes out for public release. As
for getting it on the various Atari hack websites, most of the contact/webmaster email addy's are dead. This just may be one for
the comp.sys faq. Alot of time, effort, and emails back n forth have gone into this so please don't be too harsh. :-)

Thanks for any assistance you can provide. It currently sits here temporarily; http://www.retro.dial.pipex.com/ . Here it comes..

"
Atari ST 72-pin SIMM Memory Upgrade - July 22nd 2005 - v1.02
----

0. Introduction
1. The signal lines
2. 16pin 41256 DRAM pinouts
3. 72pin 4Mb SIMM pinouts
4. Building a test-bed to identify 'good' SIMMS
5. Preparing the Atari ST for connection to your SIMM
6. Connecting your SIMM socket to the ST's motherboard.
7. Hardwiring a chosen SIMM to the motherboard
8. Hints and Tips
9. Adding a toggle switch for 4Mb or 1Mb operation
10. RAM testing programs
11. Final note
12. More notes
13. Some images at a web address
14. Static precautions
15. Credits

0. Introduction

These procedures are written to roughly describe the procedure of upgrading the memory of the Atari 520ST or 1040ST to 4Mb. This is
achieved by utilising a single 72-pin SIMM memory stick and wiring it in to replace the existing ram. All connections are made
directly to the ram banks. There is some soldering involved, well, there's actually quite

alot of very delicate soldering involved,
especially on the SIMM. If your machine has 16 or 32 RAM chips then this is for you. The procedures are also suitable for other
machines if you put your mind to it.

As a disclaimer (we're seeing alot more these days aren't we!) it has to be said that you're on your own. If you blow up your
computer or electrocute the cat when it sits on the open power supply, then don't say you weren't warned of what could happen. Use
your common sense. If the steps are too steep then look where you're going. This procedure does work and has been used numerous
times before releasing here in written form with our names on the bottom. Best of luck.

1. The signal lines

There are three main groups of signal lines. D0 thru D15 refer to what would be the individual chip selection lines, if there are
16 chips as there are in the Atari ST, then there are 16 individual chip select lines. A0 thru A8 are the address lines, by looking
at how many of these you can determine how much RAM the machine can physically address. In the standard ST configuration a maximum
of 512K can be utilised from 16 chips, or 1024k if 32 are used. If now the A9 address line is enabled (as it will be later) then we
can address 4Mbytes.

The other lines are the row and column strobes, RAS, CAS etc. Memory by it's design loses the information it contains after a short
while, these signals are used to refresh these values periodically, this is all done automatically by the memory controller.
Remember the various settings in an IBM PC compatible's BIOS for setting these? RAS/CAS delay etc.

Finally the last group are straightforward. GND and +5v provide power to the memory. The WE signal line tells the chips if they
should be receiving or sending data, WE is sort of on it's own as far as signals go, it's not a D or A line, and it's not a RAS/CAS
select line. If it had to be grouped then it could be put with the RAS/CAS lines although it is quite different.

2. 16pin 41256 DRAM pinouts

The pinouts for the chips used in the ST are as follows. Note, some ST's have 8 1Mbit chips and these revisions are not discussed
here.

```
------\_/------
A8 |1 16| GND
D |2 15| CAS
WE |3 14| Q
RAS |4 13| A6
A0 |5 12| A3
A2 |6 11| A4
A1 |7 10| A5
Vcc |8 9| A7
```

---

3. 72pin 4Mb SIMM pinouts

These are the pinouts for a standard 4Mb 72pin SIMM. On a 1Mbyte SIMM the A9 line is N/C, and on an 8Mbyte SIMM A10 is now present.
The sticks that we are interested in have a minimum of A0 thru A9 enabled.
SIMM Description
1 GND
2+3 D0 + D16
4+5 D1 + D17
6+7 D2 + D18
8+9 D3 + D19
10 +5v
12 A0
13 A1
14 A2
15 A3
16 A4
17 A5
18 A6
20+21 D4 + D20
22+23 D5 + D21
24+25 D6 + D22
26+27 D7 + D23
28 A7
30 +5v
31 A8
32 A9
34 RAS1
39 GND
40 CAS0L
41 CAS1L
42 CAS1H
43 CAS0H
44 RAS0
47 WE
49+50 D8 + D24
51+52 D9 + D25
53+54 D10 + D26
55+56 D11 + D27
57+58 D12 + D28
59 +5v
60+61 D13 + D29
62+63 D14 + D30
64+65 D15 + D31
72 GND
==========
*40 connections to be made
==========

a. A0 thru A9 are the address lines
b. D0 thru D32 are the data/chip lines
c. CAS0L thru CAS1H are the column select lines
d. RAS0 and RAS1 are the row select lines
e. WE is the Write Enable line
f. GND and +5v are the power supply for the SIMM board

4. Building a test-bed to identify 'good' SIMMS

It may be an idea to test your SIMMs in a socket first. This is discussed in the following paragraphs.

Probably one of the most important aspects here is to have SIMM memory which is actually suitable for the job. SIMMS generally come
in two flavours, EDO and FP. EDO ram is optimised to allow faster access times and is unsuitable for the Atari ST. FP or Fast Page
ram is required, and as a percentage, EDO ram is more available than FP ram to about 75%, or, a ratio of 3:1. Thus, you will need
to build a test bed first to test your SIMMS prior to any permanent fitting.

A 72-pin SIMM socket is required, these are commonly found on 486 and some early Pentium motherboards. The method for removing
these is to take a butane blow torch to the back of the board and carefully remove the socket, this totally destroys the donor
motherboard so you may as well remove all of the sockets, likely 4 off.

Having removed your now slightly charred sockets, wires now need to be soldered to the 'very' small solder pins on the back.
Recommended materials are suggested;
a. Heat-shrink to seal the connections afterwards
b. 10 6inch lengths of solid core wire for address lines
c. 16 6inch lengths of solid core wire for data/chip lines
d. 32 1inch lengths of SCW for data/chip lines
d. 3 6inch lengths of SCW for ground lines
e. 3 6inch lengths of SCW for +5v lines
f. 6 6inch lengths of SCW for row/column select lines
g. 1 6inch length of SCW for WE line

It is suggested that your data/chip lines be hooked up first. There are 16 connections to be made to the ST board, coming from 32
connections on the SIMM. So.. solder your 32 1inch lengths to the data lines on the SIMM socket, afterwards heat shrink these where
they connect, about 5mm of heat shrink each. It is further suggested to strip these wires to about 3mm before you begin. Next, the
32 bits of wire you have poking out from the socket need to be paired up and soldered to your 16 6inch lengths. These connections
will also need to be heatshrinked. That's the data lines done!! Expected time to do this is about 1-2 hours.

All of the other lines to be connected to the SIMM socket are made singlely so is quite straight forward here after. All should be
individually heat shrinked where the connection is made on the back of the socket also.

5. Preparing the Atari ST for connection to your SIMM

Unfortunately you cannot just make the connections to the various points on the ST's existing DRAM banks as the existing dram will
interfere with the signals. There are a number of ways to deal with this;

a. Remove ALL of the dram chips from the ST's motherboard.
b. Disable power and RAS/CAS signals to the dram chips, leaving them in place

Performing (a) is probably the best course of action. Salvaging the existing chips will be difficult however, as potentially
expensive and damaging methods are required to get those chips off of the board in one piece. The method here was to use a hobby
drill with a cutting disc fitted and to cut the legs off of every chip, finally removing the remaining 'stumps' from the
motherboard.

Performing (b) has the advantage that your dram chips are preserved should you ever wish to downgrade and it's less stressful.
Disabling power to the chips can be achieved by lifting the inductor L51 just next to the main power connector to the motherboard.
This procedure is not however guaranteed as many revisions of the ST motherboard existed. On my test motherboard the power area
where L51 forms a circuit also powers the floppy disk drive. Power for the FDD can of course be taken from elsewhere on the board
as there may be additional solder points, there are some here directly infront of the main power supply connector. It is only the
+5v line which is affected for the FDD, which is the red wire. The existing dram signals that you must disable are RAS0, CAS0L,
CAS1L; That's the main bank in 520STFM models. On 1040STFM models or 520ST's with 1Mbyte upgrades, RAS1, CAS1L and CAS1H must also
be disabled. This is achieved by lifting the 66ohm resistors R59, R60 and R61 for bank0, and R71, R72, R73 for bank1. If you do
not do this then you will be looking at a blank screen when you power-up. It is also debatable as to whether the +5v actually needs
to be disabled to the RAM banks, but since the ST's PSU is generally quite small, it makes good practice either way.

Please note again that as there are many revisions of the ST board, such that procedure (a) can only be suggested as solid guidance.
In an ideal world I would always choose (a) since you simply do not know how those existing dram chips will interfere with the other
signal lines.

The next stage is to bring out the A9 signal line. You have to make a connection directly to pin64 of the MMU chip to bring this
line out for use. Suggested procedure for this is to drill a hole through the ST motherboard and to place a PCB pin to the upper
side which connects to the pin64 solder joint on the underside of the board. The tricky bit there is finding somewhere for your
hole on the ST motherboard where no tracks are running. Space is tight, VERY tight. The PCB pin here was placed just behind the
main power supply connector with barely 1mm spare around it, and a wire taken between the

two points on the underside. There's also
another space just infront of the bank of resistors. You can identify pin64 with a multimeter, pin61 is labelled topside. (if you
don't know how to do this then you shouldn't even be doing it!) Having brought out A9, a 33ohm resistor will required in series to
A9 on the SIMM. This can be soldered straight to the PCB pin.

6. Connecting your SIMM socket to the ST's motherboard.
---
a. Make the D0 thru D15 connections first, these connect to one of either of the 2 dram banks. D0 for example will connect to the
space for dram chip U47 at pin 2. D1 to U42 at pin 2. Here's a list;
U47/pin2 > D0
U42/pin2 > D1
U37/pin2 > D2
U30/pin2 > D3
U25/pin2 > D4
U21/pin2 > D5
U13/pin2 > D6
U6/pin2 > D7

U46/pin2 > D8
U41/pin2 > D9
U36/pin2 > D10
U29/pin2 > D11
U24/pin2 > D12
U20/pin2 > D13
U12/pin2 > D14
U5/pin2 > D15

b. Now make the A0 thru A9 connections. It is suggested that these are made directly to the resistor bank below the dram banks and
above the MMU. The resistors in this bank do the following;
R59 > RAS0
R60 > CAS0L
R61 > CAS1L
R62 > A8
R63 > A7
R64 > A6
R65 > A0
R66 > A1
R67 > A2
R68 > A3
R69 > A4
R70 > A5
R71 > CAS1H
R72 > CAS1L
R73 > RAS1
MMU64 > A9

c. The row and column address signals are made as per the information table supplied in (b) above. It is probably easier to make

these connections directly to the resistors rather than to the dram sockets if empty. If your RAM does remain then you need to lift
up the RAS/CAS buffer resistors to separate the signals from the existing RAM.

d. WE (Write Enable) has to be connected to pin3 of any of the vacant dram spaces where the dram would be located. If you're
leaving the existing dram in then just solder to pin3 of any of the chips.

e. The SIMM's power is supplied from the motherboard. There are 2 methods here to get power. If you have removed all of your dram
chips and L51 is still in place then you may take power from the dram sockets, pin8 is +5v and pin16 is GND. More than one take off
is recommended to source sufficiant power for the SIMM.

If your existing dram remains and you have lifted up L51 then you need to find power from somewhere else other than the dram area.
The pin16/GND's will still be connected at the dram sockets although your +5v will need to be taken straight from L51. L51 seems
the obvious choice although I am concerned about sufficient smoothing being lost as the capacitors within the dram banks are no
longer part of the circuit. To be revised, this procedure is to be tested on my next memory upgrade.

REVISION: 1040ST system with both banks fitted and disabled seems to be functioning well. +5v for the SIMM is taken from the lifted
L51. The +5v for the FDD is routed from the empty FDD pad bank located in front of the main PSU connector, the +5v/RED wire has
been extended to accommodate. The RAS/CAS resistors have been lifted and laid back down onto insulating tape beneath them.

7. Hardwiring a chosen SIMM to the motherboard

At your discression. A hardwired SIMM does fit nicely on top of the first bank though. Is also an idea to have the wires running
across the back of the SIMM board rather than simply away from it, as they can be taped down to the board to provide strength.

8. Hints and Tips

The motherboard that has just been worked on with the 2 banks of ram remaining had had it's 2nd bank bodge fitted by a previous
owner (eBay purchase). Tracks on this motherboard were damaged and the standard of soldering was lumpy, it is surprising that the
SIMM upgrade did not upset things so the dram was chosen to be left in place with the minimum of upset. The first piece of advice
follows;
*Take pride and time in your work
*Plan out each job separately
*Aim to take 2-3days on-and-off to complete this upgrade
*Before even starting, get some magnifying goggles
*Prepare your test SIMM socket first, test for shorts with a multimeter
*Fit your A9 pin as a separate job, use a small manual hand drill and not your Dad's hammer

action drill
*Grinding off your ram is a separate job, and don't go through any tracks!!
*Removing the ram stumps is a separate job
*Bringing up L51, R59, R60, R61, R71, R72, R73 is only just a separate job, tea time!!

Having the right tools is another requirement for this job;
*18w soldering iron with a brand new small tip
*Magnifying goggles (already mentioned)
*Multimeter with diode test facility (or resistance) for shorts
*Long nose tweezers
*Long nose pliers
*Professional jaw wire cutters, expect to spend £10
*Dentist's tools, picks etc. (also sold as soldering tools)
*Helping hands (those things with croc clips for holding things)
*Insulating tape
*Sharp scissors

That's some of the tips I can think of anyway. Oh, one last tip for the wire cutters. You'll notice that stripping wire connected
to a delicate board isn't too practical. Grasp your wire with the cutters, and then using the long nosed pliers hold the wire again
just behind the jaws of the cutters, then simply lever the cutters against the pliers. This enables the wire to be stripped without
bending things and jolting everything.

When you start to test your SIMMS to identify a Fast Page version, it may be difficult to determine if your first SIMM is an EDO or
if you have a genuine wiring error. Trust me, I know the anticipation when you switch on for the first time. The effect of
inserting an EDO SIMM is that the screen will be corrupted with lots of coloured flecks pulsing across the screen, and, the computer
will likely attempt to boot. It may even make it to the desktop, just with coloured flecks all over the place, or it may bomb out.
If you have made a wiring error then it is likely that the screen may be blank, or it may be the case that the screen is filled with
solid coloured blocks. Just try another SIMM to see if it behaves the same way, in testing it was found that different brands of
EDO SIMMs behaved just slightly differently, a very rare few may even work, it's not known why but two were found here. It is
imagined that you will have a box of 20-odd assorted SIMMs to test. If you have sourced two SIMMs from eBay then the chances are
that these will be EDO sticks.

Before you switch on for the first time, do check for shorts and wiring errors. It only takes 10 minutes to thoroughly check over
for problems.

9. Adding a toggle switch for 4Mb or 1Mb operation

There are bugs! Surprised? No, didn't think you were. Some ST programs, namely games, will not function on a 4Mb machine. This
is caused as some misbehaving programs will attempt to address past the 4Mb ceiling, don't

ask me why they do this. Anyway, on a
520ST or 1040ST this doesn't cause a great problem as the ST's BIOS simply returns a software-error, it's trapped by the program,
and everything carries on running. On a 4Mb machine however, addressing past the 4Mb ceiling creates a hardware-error, which isn't
trapped, and the system crashes. End of story.

When writing these procedures it was decided to try to turn our 4Mb machine back into a 1Mb machine at the flick of a switch.
Interested?

A 2-pole switch was fitted at the back of the machine through the case, in the area between the PSU and FDD shielding. The A9
signal which runs from the SIMM is common (in the middle), with GND and the MMU A9 signal being selectable. In one position the
SIMM's A9 is connected to the MMU's A9 as per this document. In the other position, the SIMM's A9 is grounded. It's as simple as
that! Connecting the SIMM's A9 signal to ground turns our machine into a 1040ST. It is ok to leave the MMU's A9 floating, as it
has been for years since it left the factory.

If you should be tempted to try switching while the machine is switched on, it doesn't work, obviously. By all means, switch
between 4Mb and 1Mb with the machine powered although I don't know if this could destroy the SIMM or MMU. What has been tried here
is to switch over and then perform a reset, which seems to work ok aside from the screen corruption. On your head be it!

10. RAM testing programs

Having completed this RAM upgrade and with a gleaming desktop you of course want to thoroughly test everything. Two pieces of
software have been identified as being suitable.

Peter Knoppers, a hardened techie from Holland, has kindly allowed us to link to his ramtest program found here;
http://ce.et.tudelft.nl/~knop/#memorytest . The one thing to mention about his software is that you have to output to either a
parallel printer connected to the ST, alternatively, you can output via the serial port, connecting this to a PC running
HyperTerminal with a NULL modem cable. His software is VERY configurable, so if you have a NULL modem cable then he's well worth a
look. I quite like the software as it leaves you with a status log should your ST die or something.

Chris Swinson, of CPS electronics in the UK has suggested the MARPET test program now found here;
www.cps-electronics.co.uk/144/ramtest.zip . As far as permission to use the program goes, unsuccessful attempts have been made to
contact Marpet thus the package has been deemed abandonware. Unless anyone knows otherwise that is. It's an ok program mind in
that it outputs directly to the ST's screen, although in comparison to Peter's offering, it doesn't appear to be so intuitive or

thorough, guess that makes it easy to use! I'm not sure if it relocates itself at each run, but of course if you just want output
to the screen and to leave the computer testing then it's all thumbs up.

The final method of testing your RAM, as suggested by Chris again, is to create a whopping 3.5Mbyte RAM disk. Create a totally
black .BMP image file on your PC, and port it back and forth using the PARCP transfer program. If any errors occur then you will be
able to easily identify problems from colours creeping into your bitmap file when viewed again on the PC.

11. Final note

Where you position your final SIMM is up to you. The guidelines provided here are simply to show that it can be done, and roughly
how you might do it and to get you started. You could use your socket or you could hard wire. As for where you end up and how you
do it, that's all part of the fun and job well done.

12. More notes

To aid completeness it was thought an idea to provide web links to some of the tools and equipment used. Most of this is sourced
from Maplin Electronics in the UK who are the equivalent of the Tandy/Radio Shack shops in the USA.

http://www.retro.dial.pipex.com/stram/

14. Static precautions

We hear more and more about static, almost as often as legal disclaimers. The reality is that static is not always an issue. If
you live in a dry non-humid heated climate then yes it certainly is, we've all seen the little blue sparks and heard the crackling
on clothes. If however you live in the UK, where it rains constantly then it may not be so much of an issue. I'm saying this here
as I've just seen one of the progress photos with SIMM sticks laying all over the carpet. Some environments generate static, others
don't. It is however always a risk but the feeling that it is constantly necessary to hook yourself up to the GND's of the National
Electricity Grid is a trifle excessive. Once again, just use your common sense of what you know about the environment around you,
touch a grounded device occasionally. Oh by the way, the ST's motherboard was always sitting on a newspaper in those photos.

15. Credits

Alison Challis (techie_alison) of Cambridge UK - Author and tester of these procedures

Chris Swinson (Exxos) of somewhere in the UK - original developer of these procedures many years ago, his website is here;
cps-electronics.co.uk . Chris has been my mentor here and has provided lots and lots of patience.

Peter Knoppers of Holland - kindly allowed permission to use his ramtest program. It can be found here;
http://ce.et.tudelft.nl/~knop/#memorytest .

Christopher Hicks of Cambridge UK - his 30-pin SIMM/SIPP hack helped immensely. It can be seen here;
http://atari4ever.free.fr/hardware/ram.html .

Geir yvind V lidalo of somewhere - his Atari Stacy 4Mb upgrade helped immensely. It can be seen here;
http://atari.nvg.org/stacyram/ .

Kurt Sharp also gets a mention as he's been viewing the pictures of my upgrades with bundles of wire going everywhere and saying Ooh
Ahh. Most encouraging. Kurt is in the process of developing a RAM test program so hopefully this will enter the public domain in
months to come.

What kind of atari is a CTxx?
I have never had my hands on anything more powerful than an ST.

Like where could I go to see demos of Falcons, TT's and beyond? And can
they run at 100Mhz? (or even faster?)

Ie I gave up on atari and have been suffering with frankenstein 200Mhz
Windows crap crap and currently fortunate enough to be running an 800Mhz
supermac running OS 9.1 (virtually no support from apple).

Cheers--

2914. Re: C++ compiler (was: SCUMMVM...)

Newsgroup: comp.sys.atari.st
Date: 2005-07-23 01:22:00 UTC
From: Zorro <zorro271-1@yahoo.fr>
Message-ID: <42e19bba$0$4566$636a15ce@news.free.fr>
Source record: 12393

Coda a ï¿½crit :
> Yes there is. GCC 3.3. Ask on the mint list.

Currently, I'm close to finish my PDF reader. I have wrote that in C++.

Here my conclusions:

1) The C++ compiler from GCC 3.x.x produces corrupted binaries, nothing
to do, it doesn't work :-/

Maybe the problem is not inside the compiler itself but in the
initialisation code (crt0.o) or in libstdc++ ?

2) The "good" old G++ 2.96.x is a little bit better but still very buggy
with floating point computation; however, when I compile with
"-fomit-frame-pointer -m68020 -m68881", the application works like a charm:

http://zorro.arcadia-crew.com/tmp/68881.jpg

When I compile with "-m68020-60", the alpha layer computation are
completly wrong:

http://zorro.arcadia-crew.com/tmp/68020-60.jpg

And with "-msoft-float", I have a bus error :/

3) The very old G++ 2.8.x works very well but all the modern C++ codes
are not suitable for this compiler, so the problem remains.

Ciao,
Zorro

2915. New book about the Battle between Commodore and Atari

Newsgroup: comp.sys.atari.st
Date: 2005-07-23 01:58:38 UTC
From: Variant Press <variant@commodorebook.com>
Message-ID: <nvhEe.8634$mN.100215@news1.mts.net>
Source record: 12394

Find out more about the battle between Atari and Commodore in a new book, "The Spectacular Rise and Fall of Commodore". Learn how former Atari 2600/Atari 800 engineer Jay Miner developed the Amiga computer, and how Atari almost purchased Amiga. Find out how the Atari ST was partially designed by Commodore engineers while they were still at Commodore. Atari founder Nolan Bushnell even joined with Commodore to launch the Commodore CDTV, a precursor to the modern DVD player.

The Spectacular Rise and Fall of Commodore is a detailed history of the company behind the best selling computer system of all time, the Commodore 64. This book was almost two years in the making, using over 44 hours of interviews with Commodore engineers and managers.

Title: The Spectacular Rise and Fall of Commodore: The Inside Story
Pages: 624
Size: 6 x 9 inches
ISBN 0-9738649-0-7
August 2005

Its an expansion board for the Falcon 030. It uses a Motoroloa 68060 CPU
and allows you to use SDRAM (and lots of it!).

> I have never had my hands on anything more powerful than an ST.

A well-tuned CT60 equipped Falcon is pretty awe-inspiring. :-)

> Like where could I go to see demos of Falcons, TT's and beyond? And can
> they run at 100Mhz? (or even faster?)

Hmm, don't think there are too many demos made just for the CT60 as yet,
but I think they will be.

CT60 is an accelerator for the Falcon only. TT's are left behind.

> Like where could I go to see demos of Falcons, TT's and beyond? And can
> they run at 100Mhz? (or even faster?)
>

You can't. You put forth money and hope for the best.

> Ie I gave up on atari and have been suffering with frankenstein 200Mhz
> Windows crap crap and currently fortunate enough to be running an 800Mhz
> supermac running OS 9.1 (virtually no support from apple).
>

I don't know any computer that looks more like a Frankenstein than my
falcon, but as it boots up I remember that I don't care because it's
really really fast.

The CT60 is 100MHz because of a recent 68060 run that is more accepting of
overclocking.

As far as getting a CT60 is concerned, you most likely missed the boat.
Sorry :-/

Even if you wanted one, guessing you were in the US, Falcon's go for
$400-500, CT60 goes for $250 or something, the "special" mask of 060 runs
another $100 and we're not even getting into hard drives. If you're using
a 200 MHz!!!!! windows machine or 800 MHz supermac (if only I knew what
that is), you must have some financial issues.

The CT60 suffers the same problems as other accelerators do - same slow
bus - that's why CT60 users can't wait for things that latch onto the new
bus like the Supervidel.

Thanks,
Mark

It's a zview's codecs not a standalone application.

For the Requirements, look at here:

http://the.zorro.free.fr/zview.html

But keep in mind than due at the G++ bug, the next version will be only
useable if you own a FPU.

So, not suitable for MagiCMac or MagiCPC.

Ciao,
Zorro

> May be for you - I can use on every hardware an emulator...

This is just plain STUPID:

1st ATARI may make a lawnmover, running 0 ST/Falcon programs, it is still an ATARI product. There is not question at all what ATARI had in mind when designing GLUE, SHIFTER, VIDEL (fact that VIDEL has ST SHIFTER compatible registers clearly shows they HAD compatibility in mind) as they are the manufacturer. So 800xl, ST, Falcon, TT, ABAQ, ATARI PC, Lynx, JAG, Portfolio, VCS and so on are ALL ATARIs (altough not compatible). DELL, Commodore, whatever are NOT.

2nd U may use emulator on any hardware, thats okay. But hadware running emulator is NOT emulated machine's native hardware, so no matter what emulator u run, u use DELL (as i think u said u own DELL). Your Magic_pc is useless without Windows, so please, stop with this nonsense.

First of all, please explain to me how comp.sys.atari.st is political?

2nd, if its just advertising (which is what I do with my .sig, yet its NON political), then you don't need the obviously biased George W. Bush statement in it, do you?

Lastly, if my .sig was political and offensive to some, and they requested that it be changed, I would very seriously consider changing it. I once had a much larger .sig (anyone remember the very first .sig I used years ago here? <grin>) and others here let me know that 4 lines or so was considered a polite limit. I changed it per their request.

Its common courtesy.

As I already told Patrice, this version will now run even if I don't specify "-audio off". However, sound is coming out very crackled up and distorted. Almost sounding like signed/unsigned mixup at times.

For the record, this is on a Falcon/CT60 at 100/25mhz running FreeMiNT/XaAES. How about the rest of you CT60 users? Anyone else having probs with the sound in Doom in 0.44?

Cause humam is a zoon politicon?

---------- <nibble here> ----------
Politics is the process and method of making decisions for groups.
Although it is generally applied to governments, politics is also
observed in all human group interactions including corporate,
academic, and religious.

Political science is the study of political behavior and examines the
acquisition and application of power, i.e. the ability to impose one's
will on another.

One theorist, Harold Lasswell, has defined politics as "who gets what,
when, and how."
---------- </nibble here> ----------

Yes !!! I could hear .... something. Seems to me that the sound is
overdriven. I still have the color palette restoring problem on exit.
If noone experiences the same, maybe my falcon is sick :(

much greater ??
I'd like because I would be rich now ! ;-)

Maybe if I'd try to do a better price, it may be more attractive...?

Number of falcons in the world : around 10.000 to 12.000 + 1.000 to 2.000
from C-LAB after.
The complete PCB product from atari corp was 20.000, but only 12.000 were
assembled and put in the market pipe.
The other 8.000 were sent partially or totally to C-LAB (2 big cargo
airflights from Sunnyvale to Germany it was told to me !) : it is why C-LAB
do not modify the PCB (even it was urgent to do it : put a SIMM socket on
the mb to avoid the ram card by example !!) for MK1/2/X machines--> they
have to sold the atari PCB !

That's now an old story and we should show at the future, not the past !

Perhaps what I was trying to say didn't come across to well (lost in
translation?). Anyways, I guess we should consider out of those 12,000 how
many are still in use today. Anyone have any idea about that? If just
half, say 6000 were in working order today, it still seems to me that more
Falcon owners would have wanted to upgrade their machines. More than 287.

I'm just saying that seems like a low percentage. :-(

100-150 maybe? With term "in use" i understand Falcon is used on daily base,
not to be put out of closet once per month to play some games which dont work
in emulator :)

Hey SWE! :-)

Gosh, that just seems plain sad, ya know?

I'd have to honestly say that every Atari system I've got, Lynx, Jaguar,
Mega ST (running my BBS), and my Falcon (once I get it back together) get
used daily.

I hadn't realized that the Falcon side of the community had dropped that
low. I figured if anything, that higher end machines like the Falcons, TTs
and clones would be used *more*.

For color palette problem, did you use gem driver (in window) or xbios
driver?

Also, try also under tos, to check if audio is ok.

No worries, not taken as any. :-) I think the trouble with this world, and particularly the Internet, is that we should be using
it to better ourselves, not to argue and read into things that aren't there. Soooo, in total agreement with you. The system's
working, ..at last.

All now updated in v1.03 at http://www.retro.dial.pipex.com/stram/txt/mem.txt Next quirk is to get the html to action the .txt as a
download so that it wraps the screen.

Thanks again,

Aly

This sounds pretty much identical to the probs I am seeing here -
sounds are distorted, and when the prg crashes upon exiting the palette
is not restored.

My setup is Falcon/CT60 running MiNT/XaAES at 100/25mhz.

I will try and see if I can find out more about the crash at
termination.

OK, to add a further twist to the story, I've now just had a phone call back that it's actually correct to use a ' when something
belongs to someone or something. Thus, "The ST's RAM banks are full," is correct usage as opposed to, "The STs RAM banks are full."

Mmmm, we need the supreme leader of the apostrophe police to help us here. I'd always believed that if something belonged to
someone then it gained an apostrophe when referring to it.

Reeeeeaaallly confused here. Help!! I'll look into this one over the next few days otherwise leave it as it is now without the
apostrophes. If someone connects the A0 line to the D0 line, now that's a little more critical.

Okies, brill, will make the revision tonight sitting on retro the final one. Have also managed to dig out another scan from ST
Format with the different mothboard revisions on it, image6,
http://www.retro.dial.pipex.com/stram/

Going to try to confirm this apostrophe thing..

http://euclid.colorado.edu/~rmg/its.html
Peter Cassidy supplies another advanced guide:
It's is not, it isn't ain't, and it's it's, not its, if you mean it is. If you don't, it's its. Then too, it's hers. It isn't her's.
It isn't our's either. It's ours, and likewise yours and theirs. [Oxford University Press, Edpress News]

http://owl.english.purdue.edu/handouts/grammar/g_apost.html
Forming possessives of nouns
To see if you need to make a possessive, turn the phrase around and make it an "of the..." phrase. For example:

the boy's hat = the hat of the boy
three days' journey = journey of three days

http://www.pcrrn.co.uk/apostrophe/page2.htm (contradictions on this one..)
English is a living language, and all such languages contain irregularities. One which is relevant to apostrophe usage is it's and
its. It's is short for it is or it has as you see in the table above. Its means belonging to it, as in "It's probably spun off its
neck by now". If you are uncertain which to use, say it in full, e.g. "The world spins on it is axis" is plainly silly, so one
should use its rather than it's

People sometimes get confused when a singular noun ends in the letter 's'. Because of that 's', panic sets in and people wonder
which rule to apply. But remember, there is only one rule. Use it.

In the case of a book belonging to Cassius, we will use the 'Chaucer' rule to place the apostrophe.

Pretend Chaucer Modern correct form
Cassiuss book Cassiuses book Cassius's book

Just apply the rule and the apostrophe will end up in the correct place. This clearly demonstrates that Cassius is singular, i.e.
there is just one Cassius we are talking about, and he possesses the book.

http://www.wonderfulwritingskillsunhandbook.com/html/apostrophe.html
??

http://www.askoxford.com/asktheexperts/faq/aboutgrammar/apostrophe
The word its means 'belonging to it' (as in hold its head still while I jump on its back). It is a possessive pronoun like his.

Mmmmmmmmm, very tempted to go with the Oxford Dictionary here. Which means Derryck is indeed correct. It's its, not it's, when
describing something belonging to somebody or an entity. Trouble is that half these websites say to use it's, and the other half
say to use its. This is more difficult than assembler!!

Right!! That's it!! It's a possessive pronoun, Oxford said so!! Not that Oxford know anything, it's a complete dump. Cambridge
here..

IT'S CAN ONLY MEAN ONE THING, "IT IS."

But .. http://www.lessontutor.com/eesapostrophe.html
5. Use an apostrophe to show possession.

Example:
That is Sandra's book.
NOTE: You usually have a noun after the word that shows possession. Before you use the apostrophe, stop and ask yourself if there is
a word in that sentence that denotes something belonging to someone. If not, then rethink using an apostrophe.

DERRYRK??? Help!! :-)

Ok, I have tested under TOS now, and had some interesting results:

1) The sound is indeed 100% okay under TOS
2) The gfx pallette is not correct under TOS (While it looked fully
okay under MiNT/XaAES)
3) Even under TOS, Doom will crash when user selects "Quit" from menu.
It does not matter whether "audio" off is set or not.

Geez, why don't they do like I did (and I'm sure others have)? Avoid the
"Evil Empire" and go with Linux! :-)

That way you can have modern, up-to-date stuff and still support our Atari
addiction. :-)

I'm interested in tracking down a copy of an old educational software program for the ST called Geography Tutor from ASDE. Specifically I am interested in version 3 or higher of the main program and/or any of the optional data disks for the program. Please e-mail me at lener@vt.edu if you are in the US and have a copy you would like to sell or trade for. Thanks.

Hm in what way Linux is less dark? From Atari point of view any non using of Ataris, etc is bad. Windows, Linux, Mac? If person sell or put Atari in closet none of them is any good. Using Linux instead Windows is just an excuse :)

Sound sounds fine here, on my 100/20 MHz FalCT60.
However, trying to use SDL results in ï¿½Video not foundï¿½ at startup, the
screen turns black after a random time if I don't deactivate CentScreen
(I tried to deactivate the screen saving feature only, but it didn't
make any difference), and the game crashes when quitting.

Hi Ed,

Not sure if these people could help, Bravo Sierra Computers;
http://www.aracnet.com/~atari/st_soft.htm#top

Geography Tutor; ASDE; Educational
Data Base.; Disk & Manual..$7.50 U.S.

Might be an old link, but maybe not. Their home page refers to all sorts so maybe in luck.
Oooh, has a reference to 05/09/2005
here; http://www.aracnet.com/~atari/newstuff.htm

Hope this helps you out.

If you gain or learn something form doing the project then I dont think its a bad thing. I kinda gave up a while ago after doing my 1.44 boards, god knows how many people said they wanted one, so i spend my time and cash into getting them made then all of these people "vanish" and leave me out of pocket.. Funds I would have made would have gone into other projects. People kill themselves so don't blame yourself for it.

I for one am glad you did the article, I never documented it when I made my 4meg simm PCB's, so its usefull to have! I should really write a article on my 1.44 controller since its unique, though I imagine someone will copy the design and publish it themselves under thier own name... thats normally what happens... Plus there is so little interest in the things it would be pointless in writing a article on it since nobody would be interested anyhows.... Even if I did I would probably get flamed for it.. thats how things work these days, and thats why I have pulled out of supporting..... my final word on it all was sent to the guy at UCM a while ago, in fact I wrote a few thing in there about people flaming me when all I did was help ppl.... the friendly group isn't so friendly anymore im affraid :-(

LOL, nooo, Derryck was quite nice about it, was good about it for an honest reason. These were just the trolls at the other end of
the spectrum, ..the wind up merchants. Not a prob now, have deleted the group so should keep em going for a few days, mostly they
talk about washing machines and "Did anyone see that branch on the road this morning?, ooh we must phone the council."

Hee hee, got some pictures coming to you boy, getting ready now with the ST.. ;-)

7 SCSI?!? You are a high priest of SCSI voodoo! (I thought I was impressive for 5 on my stock Falcon!)

Seriously, what I've been running into is the following:

Given HD 8.13 and the following chain: CT60ed Falcon -- 340MB Lacie HD -- Panasonic CDR -- external terminator, I had no problem with the SCSI bus under the stock motherboard (no solders). After the board came back from Rodolphe with solders (and now 25MHz), the HD appears to work correctly, but the CDR has the following odd behavior:

1) refuses to read a CD that it read perfectly two minutes earlier "Drive P: is not responding..."

2) pretends to burn a CD (CDISO gives no errors and reports a ready-to-use CD), but the result has directory errors (that is, the CD is the correct number of bytes, but folders and files are missing from the directory).

3) adds bursts of static while playing CDs on Aniplayer

I spent much of yesterday copying 8MB ZIP files from place to place attempting to find a pattern and ... had no errors whatsoever?!? The only thing I can think of that is different is that I rarely have the external HD turned on. On my stock Falcon I've long had the habit of just turning on the device I intended to use, but perhaps the CT60 Falcon is more sensitive?

I'll find out over the next few days if my CT60 Falcon has suddenly become more cooperative.

Galen

You forget that I sold 330 CT1 and 242 CT2 accelerators before !
Some people do not need more than CT2 or CT1...
I sold CT60 to people that have not a CT2 except 1 or 2 people...

But how CT1 + CT2 are yet in use..??

If 6000 F30 are yet in use, they are 6000 that are sleeping somewhere !!
Where are these falcons ? Hey so many people are looking for them...it may
be good to locate some not used falcon !
No falcon on ebay....
Very strange...

Awwww >:D< . Can quite believe it though. It's summed up in one simple phrase, "People talk $hite," and "People are $hits." I
grew up thinking we were making the world a better place, and believed it, HA!! A bit of me still believes it, hence I wrote the
document. Was for me, and you, for you for giving me the pointers in the right direction. Was the least I could do to give
something good back. Trying to lead by example, despite being worn down a bit over the years I still believe I can make 1 ounce of
difference. Perhaps I've made it for you, or someone else browsing out there.

I'll do it :-) when I get round to it. But plenty of docs already out there on the hack sites. Alot are a bit bodgy though. The
one I'm trying to get my head round is the ACSI hard disk protocols. I'm still convinced it can be done with a single 20Mhz PIC
microcontroller and a CF card though. Is all TTL so can do everything in RISC assembler, been thinking about it quite a bit lately.
Still stuck on the hand shaking though. Without a hard disk to learn from is a bit tricky as I'd analyse the comms going back n
forth. Waffle-waffle :-)

Ah, the nice thing about doing it in PIC microcode is that the chip can be protected, with a little bit of traditional
hacking/encyption/relocating code too. <vbg>

> Even if I did I would probably get flamed for it.. thats how
> things work these days, and thats why I have pulled out of supporting.....

Yes, totally support you there. Is the reason why I don't admit to anyone that I know anything about computers, they always expect
your time, effort, and for you to take pride in your work, for nothing. "Oh you could make loads sorting out people's PCs." Been
there, done that. Enjoy the work and challenges, don't enjoy being poor and treated like I'm pulling a fast one. Being given
countless Amstrad 1640 PCs is just an insult. And I'm meant to be grateful for that!?! What the ell do they think I'm gonna do
with it ...take it down the local rubbish dump for em.

Sounds like the old MCSE newsgroup back in the late 1990's. And then when the $hit hits the fan and things turn real nasty, people
look around and say, "Why, what did we do wrong?"

I guess from the standpoint of anything that takes away from use of our
Ataris, then you have a point.

I suppose my anti-MS anything bias is showing. I loathe everything about
them. Having used MINT on my first Falcon years before, it was a natural
step for me to progress to Linux, rather than Windows.

Linux is much more in line of what my definition of what computing is
supposed to be like and about. MS="bad" in my book, and no one will ever
convince me otherwise. :-)

See ya!

Message-ID: <42e621f7$0$6052$626a14ce@news.free.fr>
Source record: 12265

I don't know why, but some people request now some CT63 and I have no
more...
It is maybe the "100MHz effect" ;-)

So I opened a waiting list for an hypthetical next production.

There are 6 boards in this list and I need at least 40 !

So, if you want one...

Why not a CT63 with mb boost? The its only a few more parts and the
board is ready?

Either way, I would be interested...

> SDL results in ï¿œVideo not foundï¿œ at startup

2 reasons for this:
- not enough ST RAM to allocate screens.
- if using GEM driver, you're not in 256 or true colour mode.

> the screen turns black after a random time if I don't deactivate
> CentScreen (I tried to deactivate the screen saving feature only, but it
> didn't make any difference), and the game crashes when quitting.

It seems the screensaver is reenabled if I select a video mode where it is
enabled. Disabling it in Centscreen only disable for current video mode.
More work needed for this in SDL.

> Maybe an audio problem with 25 MHz MBs only ?

People with audio problems under MiNT, try this under various configs:
http://membres.lycos.fr/pmandin/download/audio.zip
(it plays the given wav file for 5 seconds, then quit).

Thanks Derryck :-) You were quite nice about it, such that the changes have gone into the final version. It was ultimately dreaded
that it would be flamed in newsgroup style.

Actually overall this thread has been quite different really. Really upset me today reading NetOps suggestion that I'm a guy.
Maybe in a past life, but got me down a bit. Looked at my photos, had a little sleep, argued a bit with my partner. Have perhaps
wondered if I should curtail my writing style slightly, but am definitely assertive in real life so not sure what I'm putting
across. :-(I just like playing with my Atari ST, it's mostly free, it's hobby based, and just nice that those electronics skills
I started when I was a child are finally starting to produce some results. Have allsorts here; a Multisync monitor with a
Colour/Mono switching box, floppy disk drives with 3-4foot cables using lower capacitance leads, LCD Cubase setup on the way. All
that stuff I wish I'd known when I was 14-15 years old which I can now do now, perhaps it's age and a little bit of maturity and
patience that make it all work.

All smiles, Aly :-)

The charm of atari is that all the support comes from users and not the
corporation. That is what makes the atari community so special.

IMHO--

I thinks it's more than that - certainly I use mine daily and I
know other club members who do the same (one of them bought a
CT60). In my case I was tempted, but didn't want to recase my
Falcon or hang on an external PS. It's so nice and compact at
present, even with an internal 6.4 GB drive!

opposed to, "The STs RAM ban>ks are full."

That's generally correct - it's called a 'possessive'. But an
apostrophe is also used when a part of a word is left out, like
here "that's" is short for "that is" and "it's" for "it is".
Actually, this often causes problems for people, because the word
"its" in the sense "its RAM banks are full" is an exception -
though it acts like a possessive, it doesn't get an apostrophe!
Only when "it's" means "it is" is the apostrophe inserted.

BTW, can you do something about your line lengths in your posts
please - they do not wrap correctly in some mailers as will be
clear from the "quote" chevron in the first two lines. Normally
the RFCs require line lengths of 70 - 72 chars. Thanks!

Regards, /Peter/

I have heard that the usage is now depricated, but once upon a time
you make numerals and groups of letters plural by adding apostrophe "s".
Like this:

In the 1980's, there were more A's in sentences than Z's.

looking forward to reading this - I always thought that the history of
the Tramiels vs. Irving Gould (one third of the "Three Stooges" that ran
Commodore into the ground) would make a good book.

I see also prg crashing on exit. It happens with xbios video driver in 8 bits mode. Using '-bpp 16' works. Also I need to know if it happened with previous versions (0.43 and before). Can you check it does not happen with gem video driver under MiNT + GEM ?

Yes, i also like original case, it is nice and compact. U dont need to recase it and external psu is not that bad, if u buy 15cm extension cable and mount it on rear side and ct60. In that case u can connect external PSU same way as we did with 520ST or Amiga, c64 etc.. On back of the Falcon, there is only "PSU jack". I did that with MKX case, which is not much bigger as original case anyway..

Janez

The falcon is more special, and surely that's why.. It's a shame the TT's
are going to go to waste considering they're faster to start with. Easier
to find a good functional video card too. I think everybody understands
Rodolphe, but I was told by my old roomate that such a proposition was
made long ago and the number of required people were there, but you
decided for whatever reason not to do the project.

Thanks,
Mark

Not to mention tiny ITX PSU's are quite cheap now and could probably be
made to fit within the Falcon. I'm sure it's been done. The CT60 was
designed to fit in the standard falcon case still. It's the PSU that
needs to be taken care of.

Thanks,
Mark

A good place to start is here:

http://www.anodynesoftware.com/

ExtenDos Gold and CD Writer Suite.

I use the writer software with my Mega ST and a CDRW.

I've not had a chance to test it on my CT60 equipped Falcon yet, but it
works stock there just fine as well.

CT60 didn't fit in a normal falcon case, thats why you need ctex ;-)
I'd like to fit in a internal PSU also, its just finding the time to mess
about with it all really :-(

Well, I tested all versions from 0.40, and all had the same bug. And I
found the cause in SDL, so you can stop testing, and wait for 0.45.

I remember that. Anyway, apparently there was a fork in the road and he
had to dedicate energy to the TT or the Falcon. Personally I always
thought the Falcon users and TT users were about even. More maybe TT users
became Hades and Milan users?

Well, question is, you have a upgrade that will work with the Atari
motherboard, an '030 setup, and apparently TOS 4.06. Rather than
splitting effort to make two seperate upgrades, what would it take to have
the TT emulate what this environment is working with?

In other words, what does the CT60 look for... you say the it is hacked for
the Falcon TOS. What exactly does the CT60 work with in that TOS and with
the Falcon setup that is different from the TT?

How much of the TT is similiar to the Falcon?

In the case of the CT60.... how much of the original computer board is
actually used once the CT60 (or CT63) is working as it should?

Just humor me (and the other 30 TT users wondering this) for a few minutes.
:)

You are wrong about the fact that I may have be able to developp CTTT !
I never get more than 30 pre-orders on CTTT !!
If somebody can get 100 pre-order, it's ok for me !!
Hey, try ! move ! do announcments on NG and atari.org and anywhere
else...and you will see...

I have now no more time to try a second time to convince people on TT.
For me TT is really dead because it has no demo/game scene support, what is
one of the last support on Falcon !!

> Well, question is, you have a upgrade that will work with the Atari
> motherboard, an '030 setup, and apparently TOS 4.06. Rather than

> to have the TT emulate what this environment is working with?

4.06 ??

The CT60 use a patched 4.04 !
It took 1 year to Didier to patch all things into the TOS to get rthe result you can see this day : all integrated into the flash : no drivers to install, no FPU library to install... a great work !! really so better than what was on Afterburner (bad software installation and distribution !!)

> In other words, what does the CT60 look for... you say the it is
> hacked for the Falcon TOS. What exactly does the CT60 work with
> in that TOS and with the Falcon setup that is different from the
> TT?

> How much of the TT is similiar to the Falcon?

Hey the hardware of the TT and falcon is 80% different...
All the BIOS/XBIOS is different !
So, it is a necessity I think to start from TOS 3.06 and patch it ...it will take 1 year too ???
Too long !
Didier has no time and I understand he want to do somethings else... more interesting ;-)

Maybe it is possible to patch without the AES & GEM part and add the GEM/AES part of the Falcon TOS....but is is very complex to do...
So it is better to not dream...

> In the case of the CT60.... how much of the original computer
> board is actually used once the CT60 (or CT63) is working as it
> should?

The CT60 may be able to run without the motherboard if the TOS into the flash is patched again : a BUS ERROR special root should be added to return from all the BUS ERROR we may receive if the 060 try to access where there is no more hardware : I have to generate this BUS ERROR for all Falcon / TT addresses...and so it is possible to run CT alone.
But no VIDEO, NO KEYBOARD, NO HDD, NO SOUND !

It is why I may need to develop a PCI interface and add the EtherNAT card on the CT !

Regards

CT60 fit into the original case and you do not need CTEX for that !!!

The first CT60 have a big fan than cannot be put under the keyboard, but if you use a bit you brain, you will find a way to put the heatsink differently and be able to close the case ! I saw many people that put CT60 into the original case !! One way is just to find a smaller fan and put it near the heatsink.

SO, PLEASE STOP to spread BAD INFOS !!!

Now the CT63 is furnished with a very thin heatsink+fan bloc (have a look on my web pages !!)

All except 030. Videl still generate GFX, STRam is sill video RAM, DMA is used as before, I/O is used as before, sound system, DSP as well.. CT60 provide just faster CPU and Fast RAM. Also it can provide bus/stram acceleration, but that doesn't change anything functionality wise. CT60 falcon is basicaly same as 030 falcon.

Hi all,

i've got a IDE and SCSI drive connected to my falcon, both work fine
together.

i've copied everything from the IDE to the SCSI drive as I plan to only use
this one

I booted from HD8 form floppy to install just the SCSI drive and its not
working right. Drive C: is drive D: , I get drive C: icon but I can't access
it. The falcon is booting from the SCSI drive though I can't seem to get it
to configure correctly.

on booting the IDE detecting bit comes up IDE 00.00 then a row of funny
squiggles, it does that in HD8 config also, the IDE drive is now unpluged so
it shouldn't be detecting or using that drive.

Could the SCSI drive being screwing up the IDE in anyway ? will keep trying
though its getting annoying now :-(

Shouldnt be. The IDE in the Falcon is problematic at times. I was
getting the IDE 0:1 drive detected as a load of
¬¬¬¬¬¬¬¬¬¬¬¬¬¬¬¬ chars when using a particular 80pin
cable. When I use a 40pin single connector cable, or a double with a
CDRW plugged in, its OK.

If you are getting drive assignments that you dont expect you can force
the drive letter inside hddriver to be what you want on each drive.

Hello Chris,
I may have this BALL one your talking about for the ST. Does it
have kind of a moving ATARI floor so to speak at the bottom of the screen??
it was also in 3D and had mirror like affects on the ball itself and the
floor had shadows of the 3D ball moving forward (at you) on the screen.
Actually a very good little demo. If I can find it agian on my 4 GB HD and
or my 1 GB HD that is hooked to my 1040 STFM. I can pull them onto a floppy
and send it right over if you wish. The other one I seem to remember that
one as well but I do not have that one. If you get it I would love to have
that one to my collection. Let me know!!!

Thanks,
Carey

I can be fixed !!
It is an SDMA clock stability problem !

I think the CD driver you use is the problem ...it runs too fast with 060 !!
Did you try to remove the FAST RAM flag to allow it to load into ST-RAM
instead od SDRAM ??
It will slow it..and maybe software timings will come back to good values...

What is the CD driver you use ???

If it is the extendos, you should report to the author !! He is a CT60
developer... !
Thanks

This is correct, but usually it's better to find out why the behavior is
not as expected.

IDE and SCSI don't influence one another, indeed. I also suspect the
cable to be the problem. I had similar effects when experimenting with
2.5 to 3.5 inch adapters.

I had that ������������������ problem without the drive pluged in, I
reinstalled HD8 onto floppy and booted from there with no drives pluged in,
setup HD8, installed it on C: again, then turned on the SCSI and installed
on C:..... anyways managed to get it working now on SCSI only :-)

I do think my IDE cable is a bit bad though, its a internal 2.5" IDE, I
think SCSI will be a bit faster... also a 2gig drive not my 540MB IDE ;-)

Cheers,
Chris

>You forget that I sold 330 CT1 and 242 CT2 accelerators before !
>Some people do not need more than CT2 or CT1...

This is an argument. I have three Falcons for example.

The first one is unmodified (and will always be, just for compatibility reasons).
The second one has (of course) a CT60.
The third one has an Afterburner and a NOVA graphics card and I use it on a daily basis as long as there is no acceptable graphics solution for my CT60 falcon.

>I sold CT60 to people that have not a CT2 except 1 or 2 people...
>But how CT1 + CT2 are yet in use..??
>Where are these falcons ? Hey so many people are looking for them...it
>may be good to locate some not used falcon !
>No falcon on ebay....
>Very strange...

I also know a lot of people that still use their Falcons and have more that 1 machine.

So if you assume that there are 6000 Falcons still in use and 1/3 is nearly unmodified, 1/3 is already equipped with a decent accelerator there is 1/3 (or 2000) potential CT60/63 buyers. This means that Rodolphe already has reached more than 10% of them. That is quite a good rate I think.

Do you agree?

Regards,

Frank

I use a 10gb 3.5" drive on a 2.5->3.5 converter cos I had both lying around. You can pick up 2.5" 20gb drives pretty cheap now though, but its difficult to use all that space if your not running MiNT (and even if you are, I suppose ;-))

yeah, but thats all it does is genereate passwords, rather long ones at
that.... setting the password to " * " means they are ignored, I even tried
using the example users file and logging on with the ones in that, still no
luck. pass word or not it just gets stuck the same.

Its like the TCP protocol gets as far as to logon and gets stuck on
passwords..... I've tried a few versions of TCP.STX (I think that was what
it was called), still no look. Tried ENEC and ENEC3 STX's also... its just
so simple it can't not work really..... I had it working once when I first
brought EtherNEC, but it don't work anymore, I dontknow why. Even tried a
STFM and a new network card.... seems to be some problem in the software
somehow..... *shrugs*

Please note that there is no special size limit for C:, even AHDI will
work with bigger C: partitions. C: may be es big as any other partition,
which means it can be up to 1 GB on the Falcon.

yeah I probably could write one, but never got my CT60 to run more than
5mins without crashing, hence the need for the ram tester..... bit ironic
really ;-)

No it doesn't, what it does is to turn the passwords to "hash values". After running "generate passwords" you still enter the original password not the hash value in the file. If you don't do "generate passwords" you won't get on. It works fine for me provided I do this.

```

nope!

if you have a userfile such as....

name password c:\ 1 d:\ 7

and generate passwords...

name 348th348t9ph34p89htq34tpp234h34hqr9w c:\ 1 d:\ 7

like I said not typing in that lot for a password! the option is practically useless really.

As the CT60 came it does not fit in the case, if you remove ran then maybe
it will fit. maybe if you fit alternative heatinks also, you your self said
not to try to remove the heatinks as of risk to the CPU!!!!!!!!!

So as as said it does not fit, it is not bad infos, you talk about
modifications to CT60, hence you only need modifications since IT DOES NOT
FIT!!!!!!

dun matter found um hidden away in the software package!

it says hold some keys down before the logo to enter a diagnostics mode,
which sounds fun... if it would actually come up ?!

3072. Looking for two ST programs

Newsgroup: comp.sys.atari.st
Date: 2005-07-29 00:43:58 UTC
From: Chris <thisisjustadummy@dummy.com>
Message-ID: <dcbu3e$n4b$1@lnx107.hrz.tu-darmstadt.de>
Source record: 12246

Hello everyone,

I am looking for two ST programs that I know neither the names of nor where to get them.

The first one is an Omikron basic program that creates and rotates a 3d ball, that is, a wireframe model of a ball. The person who showed me this back in the 80s told me he wrote it himself, but later other people told me this was a demo that came with Omikron basic. I don't know which is true but if you can help me getting this program I'd be very glad.

The second one is a (stand-alone) demo I only remember vaguely. It is a kind of programmed movie sequence of a miniture flight into the interior of a computer. Does this ring any bells with anyone?

Thanks in advance for any help,

Chris

holding down both shifts skips SDRAM

ALT-C opens up a new drive window for C:

CTRL-D changes the screen to drive D:

all keys working fine me thinks.

booting without SDRAM changes things a bit, instead of getting a crash
screen the screen just goes black and either locks up and/or resets.

I've got CTCM comming so I can have a play with that, though im getting
tired of trying to get the thing to work :-(

I've tried 3 or 4, 133mhz CL2 128MB Crucial the one which is in now.

a while ago I sent my falcon with CT60 to rodolphe for testing, he sent it back saying theres nothing wrong with it, the only thing I didnt send was the hard drive, thats why I've trying moving things to SCSI, its the only thing I can do really. The only other thing would be to scope out all the necessay PSU,data,address lines etc and see if I can spot anything amiss between 030 and CT60 mode, its rather time consuming though probably just be easier to take the thing out and forget out it. I could send it back to rodolphe though I really can't see the point.

the diagnostics sounds interesting, though like I say that don't work either :-(

3083. [GAME] pmdoom 0.45

Source record: 12159

Hello,

This 0.45 release has only SDL bugfixes, not much change on Doom side.
However, I added memory left on ST-ram, because with 4MB ram, the game may
not have enough memory for video or audio buffers.

I dont think the diagnostics are gonna help you.

Thought... put a multimeter on the PSU lines and see if the voltages
are in tolerance (esp 3.3v).

Thought 2. Are you running NVDI at all?

Will check PSU, its a 400W jobbie, ive tried several suppies...

im only running plain GEM.....

ive taken some screenshots of the crashes, will uploaded them shortly.

actually if you read my other post I did send my falcon and CT60 to you for
testing some time ago, I dont have too much time to play with my falcon
these days so this is why I keep posting from time to time about it.

I will upload some crashes... plain GEM, booting or changing video mode,
that is all!!

Jean,
Actually that is an average. There has been many times where I get
175 KB/sec. But there are rare cases where it dips to 50-75 KB/sec.
Usually longer transfers tend to fall in the 75 to 100 KB/sec. But just
20 to 50 megs will give me easily over 100 KB/sec. I could try and get a
screen shot if you dont believe me. I use Magic 6.20 FTPSERVer for the Atari
and Fiffi as my FTP client. Connected to a router. On the MAC side I forget
actually how I set it up over there. But they are just a few feet from
each other so I run short cables and I am sure this helps. The MAC seems
to have superior networking capabilities that keep the data streamed better.
I know this because I have tried transferring data to a PC using my exact
setup and it seemed slower.

Thanks,
Carey C

Hello,

How do you get this astouning transfer rate ? would you run MiNT ? on
my 100MHz FalCT60, I hardly get 40 kb/s between a PC and it :-(

Thanks,

Hi,

Might sound like a silly question, but how do you get a Mega STE with an internal SCSI drive to boot from floppy?

Have tried and tried and tried. Not helped with it being a German TOS 2.05. Just bought it off of eBay for £50, no real yellowing, just a bit grubby, into the bath it goes for a good soak (minus the components naturally). :-)

Thanks again,

Aly

1. Must be a cold boot.
2. Immediately after mem test finishes, hold down ALT.

You can abort the mem test, I usually press space then immediately hold down ALT.

This works for disks that boot from the AUTO folder. Boot sector booting disks (like some games) will boot without your intervention.

Coda.

Can you try this http://membres.lycos.fr/pmandin/download/audio.zip and
test under various configurations (tos 030, tos ct60, mint 030, mint
ct60)?

If there is not enough ST ram for audio/video buffers, then Doom will
exits. And for video buffers, it tells how many KBytes are needed.

I just downloaded and looked at those pics. Others will be able to tell you better than I, but on my setup, I believe it was faulty, "not CT60 friendly" programs, ACCs, and CPXs that caused crashes on my machine that looked like what you are seeing.

Particular, the flag must be set for a lot of apps so that they don't load into Fast ram but ST ram, or are delayed in what they do. (again, others will step in here I'm sure, and explain better than my pitiful attempts).

Did you download the software package from Rodolphes website? The one that has things like the updated main CPX control accessory in it? Thats a must have.

If it is some apps/software, I'd start by disabling *everything* and booting up just as "plain Jane" as I could. Thats how I found what software was giving me errors like you are seeing.

Hope this helps.

Some google results (look older though):

http://www.umich.edu/~archive/atari/Info/atari-ftp.sites
http://www.dsv.su.se/~fk/AtariFTP.html

Hallvard Tangeraas used to maintain a very good list, but I don't think he
does anymore.

I also have a list on my BBS, it should be more current than whats above.

the screens were either changing res of booting, that was plain gem. im
lucky to get as far as the desktop!

disabling SDRAM seems to help, though it still crashes on loading programs,
so even so still something else wrong somewhere.

Before I'd go with MultiTOS, especially for multitasking, I'd recommend
Neodesk/Geneva, and altough I'm not a big MagiC fan, I guess I'd still
have to recommend it over plain MultiTOS as well.

My first, best recommendation though, would be to take the time to learn
and install MINT.

> lucky to get as far as the desktop!

Honestly, that sounds like its because some AUTO folder programs or
ACC/CPXs are causing your problems *first* before you get to the desktop.

You need to do like I mentioned before. Download the updated software for
the CT60. I believe you can get it from Didiers or Rodolphes web sites.

Disable all your current software. All AUTO folder programs and ACCs/CPXs.

Don't try to load a kazillion things at once. Start by adding one AUTO
folder program, or ACC, or CPX at a time. If it works without crashing
move on to the next piece of software.

Trian 'n error is the way to go. I had to do this with my CT60 Falcon.

Use the software from the package you downloaded.

Included in it is the the info/config CPX where you can set the flags you
need on software.

HTHs.

You dont have to use the unix "features" of MiNT. And its not lynux (sic) based.
MiNT is basically a TOS not GEM replacement (developed from MULTITOS). The Unix part of the MiNT distribution (Sparemint) is just a set of GNU unix based tools. You dont have to have them but it gives you a lot more power and freedom if you do.

Download the latest Freemint package which includes the MiNT kernel and an AES (XAAES) and put your desktop of choice with it.

You dont want to run MULTITOS, plus the AES that comes with it is full of bugs.

no I mean if you disable the auto folder, CPX, EVERYTHING, it does not
matter, I went though all this some time ago, I thought a CPX was causing a
crash, so disabled them and rebooted several times enabling each CPX and
auto program one by one, eventually after hours of work I ended up with
nothing disabled and it worked fine. went back to it a few hours latter and
just kept crashing over and over. If I turn off my hard drive and put a
blank floppy int he drive then *maybe* I can get to GEM more often.

and yes I got all the new cpx's and stuff and updated.

I guess its just not to be :-(

Ignore em. Only 7 is of interest, and that only puts the option to format HD floppies in the format menu on Gem (whether or not you have the hardware).

Coda.

Okies, ta.

I'm going to write all this stuff up about the MSTE as I gather the
information then post it out there somewhere.

3125. Mega STE Language Disk

Would anyone have a zipped or .ST image of the English MSTE Language Disk? Have found lots of German MSTE images out there but only standard English ST/Mega disks.

Am guessing that the CONTROL.CPX / .ACC is updated for the 16Mhz function etc. Have the German one..

Thanks :-)

Aly

Patrice.

CT060@80mhz/25mhz, 64/16mb Tested doom.wad and doom2.wad

Under single TOS: (clean boot, nothing loaded)

Runs about 1 frame a second. Sound effects works fine. No music (is there supposed to be?)

Under MiNT: (Freemint 1-16-1, XAAES, Thing, nothing else)

Runs about 10 frames a second. Sound is horribly screwed up. I guess the same as what other people reported with 0.44. This isnt an inverse sample problem, its like the sound matrix isnt set properly, or the wrong clock is driving the DAC.

Points:
1. Im going to try mobo @16mhz, but I have to put the 25/16mhz mobo boost to a switch on the front panel first.
2. Im guessing that your command line options dont match the original doom, as -nosound and -nomusic dont do anything. If so can you post a list of options?
3. On default I usually have Iphiginie running to set the matrix so that my sound goes out through the FDI/SPDIF instead of the headphone soicke. I notice that when doom starts it initialises the sound system and removes the clock to the FDI. Any way of keeping the FDI output while setting the sound as normal?
4. Rename doom.ttp to doom.prg and it runs at least twice as fast...?!?!
5. Press F1 for the help screen. Another key to get to the second screen. Dies with the message: "W_GetNumForName: HELP2 not found!". This may mean that my .wad is corrupted. Can someone else check this out?
6. Under MiNT the average load while doom was running was only ~30%

Exxos: Already there ;-) Just trying to decide what little thank you-prezzie I'm going to put in the jiffy bag.

Ah, now totally fluent in Atari German ;-) Have partitioned and formatted the disk now with AHDI 5.0, tried to patch it with the effect being that it won't do a thing without a floppy disk in it, so reverted on the patch. May do 6.05 tomorrow to see how that behaves.

Thing that confuses me is that if a floppy disk is present it HD boots immiediately, take the disk out and it adds another 5-10 secs before it'll recongnise the space-bar being pressed and then the FDD light stays on continually until a disk is inserted. Should it do that? The only HD related visible file I have on the HDD is SHDRIVER.SYS in the root, removed AHDI.PRG which was in the AUTO folder as it was loading twice, so guess that's install already in the boot sector. As already mentioned, if I patch AHDI with HD_PATCH then it stops recognising the HD as a logical drive.

Have read the experiences of others on the various forums so trying not to duplicate here, their problems seem to centre around HD upgrades and formatting alone.

Lots to write up.

Will boot from floppy if Ctrl-Alt-Del is pressed, then ALT for a short while until it picks up the boot sector with ALT still being held, else gets halfway through the FDD boot and reverts to the HD boot. Can't get it to do it from power-on ALT or reset ALT though. Takes a bit of getting used to to get it right, bit of a black art this MSTE floppy booting.

Aly :-)

Okay, (I'm trying to make sure I've got all this straight! :-))
if you have all software disabled, then it still crashes?
If so, its something besides software, I would surely think. What kind of
memory do you have installed? Both ST and fastram. I had heard that
certain 4-14 meg ST ram upgrade cards don't work, and that lower quality
SDRAM doesn't work. Also, I've been told that a lower quality power supply
can cause erratic problems. In addition, have you got a good heatsink/fan
on your 060 CPU?

As to point 2 above I really should have read the README first!

Doom now works in TOS with a just about playable frame rate. All I have done is updated the CT60 from 1.02b to 1.03c. Im not sure if that is enough in itself to fix the problem. I may go back to 1.02b to test the theory.

BTW, I just have the doom.wad and doom.ttp (renamed doom.prg) in the directory. There wasnt a CFG file until after I had run doom in MiNT several times. Until the CFG file was created Doom didnt run at all. Should I have taken this from the PC's Doom folder?

Coda.

> Okay, (I'm trying to make sure I've got all this straight! :-))
> if you have all software disabled, then it still crashes?

yup, though it does not do it all the time, I would say its like a thermal fault, but it seems to work better when its been left on a bit, though not by much.

> If so, its something besides software, I would surely think. What kind of
> memory do you have installed? B

Its crucial 133 CL2, I tried another stick though CT60 didnt find it so assume its too slow for it.

oth ST and fastram. I had heard that
> certain 4-14 meg ST ram upgrade cards don't work,

I have a ram card, ive tried 4MB and 16MB, can't remember what kind, EDO I think, I tested that out with my fav ram tester for a hour and that passed perfectly (this was why I was asking about TT ram testers)

and that lower quality
> SDRAM doesn't work. Also, I've been told that a lower quality power supply
> can cause erratic problems. In addition, have you got a good heatsink/fan
> on your 060 CPU?

yup, the one which came with the CT60... with fan it idles at 38deg I think it was, without fan 42deg.

PSU ive changed several times, all different makes and models.

When I do boot auto folder programs, it will say work a few times then refuse to boot, then it will work a few times again.....

Something is tripping up somewhere, I thought the IDE drive was to slow and caused problems, but im using SCSI now and still the same.

CT60 seems to run a lot better with SDRAM disabled, those crashes I uploaded were just booting or changing video mode, I dont get such crashes with SDRAM disabled..... Though the other problem is I can't get STOS to boot in CT60 mode and it used to work, works fine in 030 mode. I think the STOS falcon extensions I use init the falcon bus on booting which is causing the crash.

I would relaly like to get CT60 working with STOS Falcon extensions, though I get nowhere near as far as investigating why it crashes.... no point since I have all these other serious problems first to contend with... I suppose I could write a small prog in STOS for the auto folder to disable the blitter to see if that helps...

Cheers,
Chris

Hello, all!

STinGadel has made some fine, fine progress. The Beta test has gone quite splendidly, and the telnet service has been as stable as I could have asked for.

It is now configurable to any listener port (defaulting to 23). I've implemented most of the old Citadel BBS commands and features.

If you're interested in logging directly into an Atari ST, right through the internet, telnet into 'bbs.coldwinterknights.net' for the beta test of STinGadel, also known as Cold Winter Knights BBS.

For continuous progress updated, watch the website

http://www.coldwinterknights.net

I've got a few more features I want to add to it before I feel comfortable releasing any versions, but it shouldn't be too long, now.

I can confirm the speed increase both in tos and in Mint if I rename doom.ttp to doom.prg. I think the speed increase in tos has nothing to do with the update to 1.03c.
If I run doom.PRG in MiNT, the sound seems to be more distorted (if it can be ;)) But in TOS the sound is excellent. Really.

Hi Ed,

All work for me except for the atari.xs4all.nl

I've tried typing it in just as above but get a bad page.

If I use FTP:// in front of it, I get to the site, but get disconnected
with a message
saying that I don't have permission to access the folder.

Is this a anonymous FTP site?

And or is there things like a password needed to access?

Maybe a different port number or something?

Anyone else have a Hybrid Arts SMPTE Mate Plus?

I need some info on this piece of hardware, just got it recently.

Have no Manual for it, which I really could use.

I know Hybrid did alot of MIDI software and about Tims Atari Midi Site.

Looking for info on what this is capable of.

I Googled for info, but couldn't find anything specific.

Did any software come with this hardware?

Also is this device Falcon compatible?

Any info is appreciated,

phantomm@bellsouth.net

It does that so if some one fetchs the password file its useless. You still
type "password" as the password. It then runs it through the same routine as
it used when you did a generate password, gets
"348th348t9ph34p89htq34tpp234h34hqr9w" and bingo you are in

failing to understand, if the passwords are in the "password file" and that
is now not the actual password, so *where* are the "actual" passwords stored
? they have to be stored somewhere if not in that file then how does the
program know what the passwords are ? it does not make sence.

Chris

I think you ment it encrypts them!

anyhows, I just dragged the FTPUSER onto the APP and the bloody thing it logging on now!!!!!!!!!!!

god knows why, the generate passwords altered my file so it found it, something screwed somewhere, gonna get cracking now :)

The Atari GENERAL.CPX is the same for all computers. It detects which machine it is running on and displays the appropriate options. On the MSTe it will switch clock speed and enable/disable the cache. On the TT the cache enable/disable is available. On the Falcon or ST(e) neither option appears.

I have the language disk if you want a copy.

Hi,

100kb/sec i not that fast, i have average arround 250-300kb/s with peaks
over 400kb/s on CT60 and average od arround 180kb/s on CT2. It is Falcon +
ethernec + assemsoft ethernec drivers + MiNT OS.

Hello,

Sorry about that. Now and then I do have trouble with it. Try this site:

ftp.cs.tu-berlin.de

If you want 8-bit file goto the University of Michigan website and go into the
Atari archives. You will see both ST and 8-bit file sections.

Ill tell you what, because im not going to stoop so low as defend a M$ software here, YOU tell ME what *single* piece of software can organize your life (if youre so inclined) as completely as outlook, and sync it with a PDA.

?

3154. CTPCI

Newsgroup: comp.sys.atari.st
Date: 2005-07-31 15:39:12 UTC
From: Rodolphe Czuba <rodolphe.BeurkSPAM.czuba@free.fr>
Message-ID: <42ecf0e6$0$11898$636a15ce@news.free.fr>
Source record: 12080

I'm planning to design and produce a PCI adaptor for CT60/63...

For that I need at least 100 pre-orders... the list of pre-orders is open up to september, the 30th of 2005 !
At september 30th, if there is not 100 boards on my list, the project is definitively cancelled or I will check to increase the price of the board !

You can see what will be this adaptor here :
http://www.czuba-tech.com/ct60/CTPCI.GIF

- It is a small card that plugs on the CT60/63 bus and uses a PLX 9054 LOCAL-PCI bridge.
This modern bridge is the successor of the 9080 that was used in the Milan. It is register backward compatible...
- Because some of you have ATX tower case, they will want to use the rear brackets of the tower or at least use a rear place. So the other part of the CTPCI is a board connected with two 40 wires ribbon cables (must be short) with 3 PCI slots (one for graphical card and 2 others for what people will be able to do & develop).
- The slots will be 32-bits with ajustable clock for PCI (default will be 33 MHz and you may tune it up to 66 MHz : the PLX is not able to run PCI 66 MHz !). Voltages will be 5V and 3.3V power (no 3.3V on Milan PCI slots !).
- The adaptor will be slave and master PCI : this means that the PCI cards will be able to initiate a PCI master transaction to local bus and so SDRAM of the CT60 without CPU (the eclipse board is just slave, no PCI mastering and the CPU does all transfers in the 2 senses !).
- There are several good PCI graphical cards available : one will be to be choosen by the developer(s). Several developers are ready to help and contribute, some of them have already contributed with fVDI by example !). So I'm confidente for this technical point...
- I will try to design the PCI socket PCB to be cuttable between the first and second PCI slot (to have a single PCI slot card) to allow some of you to try to integrate a small graphical card into their falcon case...(why not).
- Yes, it will be possible to plug the EtherNAT board under it.

If I receive the 100 boards pre-orders, I will design the board...and will request you to pay by advance. The payment is my only assurance that I will not be with some unsold boards after : 10 to 25% of people do not honor their pre-order (do not pay and do not give sign of life !).
Do not send money until I give you my decision (after 30.09) !
Do not forget to give me your name (for those who send me anonymous emails !).

Price : 120 EUR, maybe a bit more (140).
Delays : 1 months to design + 1 month to produce prototype and try it with some software developers. After production may take 1 to 2 months according

the delays to get the parts (here the only that may give problems is PLX).

If you have some questions to decide, do not hesitate...

Rodolphe

I'm honestly not sure what you mean by "organize your life as completely
as Outlook".

But...

there are lots of Linux choices that sync with PDAs.

Hi David,

Yes please :-) Would definitely like to grab a stock copy of the MSTE
disk. Not sure how much it differs from the ST one (GENERAL.CPX) but
would like to get it in my 'formal' disk collection.

The email addy on here is valid :-) Just an account I check
occasionally, using yahoo as seems to bounce all of the newsgroup spam.

If you're happy, I can put the disk up on-site to make it available to
others.

Aly

Ello ;-)

Not wanting to dive into this debate here, but if you have some of the good (and very small, non bloatware) firewall software installed you'd be shocked to see what Windows software gets up to.

We tried this a few years ago and you have things like Word n stuff, getting totally obsessed with connecting to the net at various ports etc. If you stop it from doing so it just totally slows it down and things. Lots of MS software, and other software does it too.

An MS machine knows when it's connected to the net.... You won't get my Dad near an MS based machine, still using an IBM XT 286 with IBMs war-on-MS rewrite of DOS (IBM still support DOS, even now). Uses Net-Tamer for net communication. Refuses to be swept away in the computer boom, as went through it in the 80's and early 90's. (ooh, here come the next lot).

Here are some informations about the Pegasos

The board was developed by bplan. Actual version is Pegasos II mainboard:

http://www.bplan-gmbh.de/

Dual G3/G4 microATX Mainboard - Codename PEGASOS

- microATX Mainboard 236mm x 172mm
- 133 MHz Prozessor Slot
Optional mit 350 MHz G3 PowerPC? / 512k Cache
bis hin zu
Dual MPC 7450 G4 PowerPC / 2 MB Cache in aktuellen Taktraten
- PC133 Hauptspeicher mit zwei Steckplaetzen
maximaler Ausbau bei Modul Verfuegbarkeit 2GB Ram
- AGP Slot
x 2
vom Anwender frei waehlbare Grafikkarte
- PCI Subsystem mit drei Steckplaetzen
fuer Anwender spezifische Erweiterungen
ein PCI Steckplatz mit Riser Card Option
- IEEE1394 VIA VT6306
mit 100/200/400 MBit Datenuebertragung
mit drei Anschluessen
mit drei Anschluessen
- 10/100 MBit Netzwerk Realtek Phyceiver 8201
- USB I/O System
VIA 8231
mit vier Anschlusssen
- AC97 Sound Subsystem
Sigmatel STAC 9766 Codec
mit Mikrofon Eingang, Line In/Out
und Headset Anschluss
optischer S/PDIF Ausgang
- IRDA
zur Komunikation ueber Infarot
- ATA100
VIA 8231
mit zwei Kanaelen zum Anschluss von vier ATA Geraeten
- KBD
furr PS2 kompatible Tastaturen
- Mouse

fuer PS2 kompatible Zeigegeraete
- Seriell
fuer ein RS232 Geraet
- Parallel
fuer Standard Drucker (Centronics)

fuer Standard Drucker (Centronics)
- Floppy
- Gameport
fuer PC-kompatible Joysticks
- 56K Modem
integriert

This board was the base for a PPC bases PC from genesi, which can run
MorphOS and Linux.

http://www.pegasosppc.com/

The PegasosPPC Platform is based around the Pegasos II motherboard:

You can get teh mainboard from genesi:

a) PegasosPPC

* Micro ATX form factor (236mm x 172mm)
* OpenFirmware (IEEE1275) boot interface
* Marvell Discovery II (MV64361) System Controller
* G3 or G4 PowerPC CPU
* 184-pin 266MHz DDR RAM sockets
* 1x AGP slot
* 3x PCI slots with riser connector
* 2x ATA100 IDE Channels
-* 3x IEEE1394 ports (400Mbit)
* 3x USB 1.1 ports (12Mbit)
* Gigabit and 10/100 Ethernet
* AC97 Audio Subsystem
o Stereo audio
o Microphone
o S/PDIF optical output
o PC Gameport/MIDI
* IrDA, Serial (RS232), Parallel (IEEE1284) and PS/2 (Keyboard & Mouse)
* Floppy drive connector
I also, but i have some ideas
- Pegasos II Motherboards $499.00 (EUR415.00)
Includes SmartFirmware, back panel, User Manual.
- Pegasos II Processors (This product is the CPU board ALONE.)
Pegasos II CPU Card - 1GHz G4 (7447) $249.00 (EUR199.00)

There is also a complete Computer based on this board. It was named the
Open Desktop Workstation and you can by it as a Linux PC which can also
run MorphOS and Amiga Software.

The Open Desktop Workstation is based on the Pegasos II using the Marvell Discovery II Northbridge and system components of the highest quality.

> A PPC Atari I would love to know more about.

I also, but i have some ideas.

There is also a project with a coldfire board. It may be an interesting project, but i think it is more easy to use an existing board. The coldfire will come to late. Ii it comes in a few years, there is no one left who will use a Atari clone. A project which is made in the someones free time takes to long.

With the Pegasos a possible hardware is available and this board has many interfaces. A bit like the Atari St at is time. All you need is builtin.
Because linux is running on this board, it can be a base for Aranym.
But Aranym uses an underlying OS. in my opinion it was a little bit to much emulator for an PPC based Atari clone. While talking with my friend a got some ideas how to write a PPCTOS based on existing projects. I would like to use as much existing projects as possible. I would like to use the drivers from linux, some code i had to write, the 68040 emulator from Aranym and EmuTOS without Bios. All bios calls leave the emulator and are handled by teh linux drivers.

This can be a possible way to a PPC based Atari, and i think the fastest way.

Regards
Michel

reminds me of that "notepad" security fix where hackers could take over your
computer *giggles*........

I always used outlook too..... In fact the way it started was I couldn't afford to pay 100's for modems and net software, my first PC "the brick" old 286 jobbie with DOS and 3.11 cost me nothing, just collected spare parts from people I knew and eventually got a PC built up and on the net... latter 95 and got started with outlook...

A Atari OS would be great virus wise for sure, data would be much safter in atari format..... though for me I can't take the plung to the Atari mail, been trying to get my falcon to work with CT60 for like a year.... thats the BIG problem... if my falcon breaks, im screwed along with all my files.... if my PC breaks, assume the GFX card sets on fire, change the MB, gfx... easy fixes and im away again.... can't exactly pickup a new falcon MB when needed.

There pro's and con's for both..... though for the really serious net use who depends on E-mails (like I do) I can't afford to be without E-mail even for a day... and hey I even have another PC as a backup PC, all my data gets backed up and sent to the other PC... so if mine screws up at worst blowing up the drive and loosing all the data, I can just switch to the second and use that and reapir my main PC at leisure.... I'm affraid thats just not possible with a Falcon..... I can't imagine using a ST for it either, too many issues there to get into...

Atari is fine for probably the small general user, or hobbie guy, but if a PC breaks there are floods of parts for the taking, plenty of PC repair shops willing to break it even more.... just can't say that for the Atari scene.... Its not a matter of people dont want to use them, I'm sure a lot of people are all for using a Atari for E-mails and such, but when the thing dies, where you gonna get it fixed ? Where you gonna get spare parts from ? How much is it gonna cost ? how long is it gonna take ? When you add it all up, a PC wins hands down im affraid.

I'm not taking sides or trying to start a war, if I was I'd use a ST ;-)

The actual passwords are not stored any where. Most password files work like
this. Its called a "hash" its slightly different to encryption..

Hello,

Okies, have the uk version of XControl now, so getting there :)

One thing does puzzle me though (what again) and that's how to set the desktop colour. This awful grainy green is dreadful, as much prefer the original solid green when switching from mono.. Have so far edited the NEWDESK.INF file directly to put this to solid but there has to be an easier way.

Just checking before I click 'Send'... Nope, definitely not happening here, Windows Colours is about as far as it goes.

Using XC 1.31 downloaded from here; ftp://gem.win.co.nz/hall/cpx/

Thanks,

Aly

Yes, but even though Atari is my computer of *choice*, when I have to use
a regular PC I *don't* have to use MS and its bloatware. Linux is mature
and stable - its what I run on my 3 comp LAN here.

Beats Windows to death and leaves it begging for a mercy kill. :-)

The better thing surely to go to SCSI HDD !!!
You may get some new problems with SCSI because of the famous SDMA clock patch !!

If you have doubt about your IDE HDD, replace it !!
That's easy to find old and good IDE HDD on ebay !!

I already told several times that some HDD IDE are not able to run coorectly on a falcon even if the bus is not accelerated because the HD Driver is running too fast with the 060 + SDRAM (TOS)...

I can only recommand a old and great QUANTUM FIREBALL !
A really bomb that was rating up to 9 MB/s on a F030 + CT2b !

You may go to 6 MB/s on a falcon + CT60.

Compared to poor SCSI with it's 1.5 to 1.8 MB/s, this gives you no problem to choose between to move to SCSI and to replace the IDE !!!

I think I may have damaged my Falcon cartridge port by plugging in the EtherNEC upside down! Now my Falcon/CT60 just resets over and over as soon as it is turned on with the EtherNEC plugged in. Without the EtherNEC it boots fine. This really stinks because I have gotten so used to MintNET and multitasking now! The EtherNEC still works with my STe, so I don't think it is damaged, but I wish it was that instead of the Falcon! Can anyone offer help here, or am I doomed to single TOS until the EtherNAT comes out; somewhere over the rainbow?? :-)

apparently there are fuses on the port, if they blow and you plug somethign
in, its probably pulling down some address lines causing the rebooting.

Hi,

Thats right, I wouldn't worry about damage to the Falcon! There is a
fuse located on the Falcon motherboard near the cartridge port. I
can't remember the part number, but it's something like 0.5A or 1A but
doesn't look like a regular mains/household fuse. You could bridge it
with a single strand of copper wire, but only if you don't plug things
in upside down again :-)

3182. Atari - PS2 converter project

Newsgroup: comp.sys.atari.st
Date: 2005-08-01 12:31:21 UTC
From: exxos <exxos@home.co.uk>
Message-ID: <42ee15bc$0$13712$cc9e4d1f@news-text.dial.pipex.com>
Source record: 12109

Hi all,

I'm thinking of building up a small kit to allow a PS2 mouse to connect to a ST. Its not the same as Effile as such. The proposed project will be a small board (about the size of 2 regular stamps) which will plug direct into the mouse port ont he ST. The PS2 mouse will plug into the other end of the board. It will be a small compact design and won't require any case mods or anything.

Note that his is only for the mouse not the keyboard. With the demise in ST mice and the cheap flood of PS2 mice I think the project if worthwhile.

It will take some time to develop, techie_alison has been kind enough to research the programming behind the device and PS2 protocols. I hope to have a few test boards made up over the next few weeks. After that will be a more updated design. I imagine each kit will probably retail for around £15, it will be a plug and play solution.

If there is enough interest in the project then I will consider building a small batch and get the boards made up at the PCB factory. If there is not much interest then I won't go further than the sample boards. If there is interest then great, more people = cheaper prices and a factory manufactured design.

your choice!

Chris

Speaking of the Eiffel, the mouse protocol conversion work will have
been done already, so why re-invent the wheel? Can't you adapt the bits
you need from that? (Copyright issues not withstanding).

>
> Coda.
>

Yes and no, the first batch will be a very basic "copy" type design. Though
it uses older parts which are expensive, if there is enough interest then
the project will be "re-coded" to use cheaper more ready avaliable parts,
Though of course its only worth doing for larger batches.

Message-ID: <42ee3043$0$13712$cc9e4d1f@news-text.dial.pipex.com>
Source record: 12112

I give in,

What is the address range of the SDRAM on the CT60 ? I have a 128MB stick so
if anyone can tell me the address ranges then I will just write a program,
its only peeking and poking into ram, easy enough, probably wont be to fast
but at least it will work!

any idea what ram pattens to use ?

I'm guessing for a 8bit type one things like...

01010101
10101010
00000001
00000010
00000100
00001000
00010000
00100000
01000000
10000000

That *should* do it ?

Chris

I remember seeing a website showing how to build something like this, based around a PIC. Sounds similar to the mouseburster from Mario Becroft but using PS2 mice (good idea!!). Serial mice are long gone.

Michael,

We tried to get a development system to port MiNT. Genesi promised a development system. They asked for the address to send the system, they NEVER sent one.

They would respond, then stop for a few months and start up again. After almost 2 years of playing pong with e-mails.. still nothing. I gave up late last year on contacting them any further.

The Pegasos was in our minds the best option to get new hardware. Custom Atari Hardware with it's small production run makes it expensive. I'm sure Rodolphe could agree with that. With the Pegasos being multi platform they had a wider base to make larger production runs to help bring the cost down. ($399 USD for a G4 system)

But, I doubt Genesi will be around much longer. Our best bet is to support Czuba with his Hawk project and also try to get the Pegasos Linux community behind him. Remember, the more units sold will help bring the cost down.

Rodolphe - Any chance of you getting the Hawk information on your website soon?

Rob M

> boost to a switch on the front panel first.

Ok, for all people who try to run Doom on their system, and have problems.
You must check without anything loaded, then progressively add features,
till problem arises. You must add features one at a time, to be sure what
feature is causing the problem. It can be any of:

At system level:
- tos/mint/magic
- gem/xaaes/naes/magic aes
- accelerator board on/off
- fastram present or not, and its amount
- amount of stram available

At SDL level:
- xbios/gem video driver (in sdl, switchable with environment variable
under MinT)
- audio driver (in sdl, switchable with environment variable under MiNT)

At Doom level
- software features, like audio on/off, texturing on/off, etc...

Telling it does not work on config x.y.z is not information. What is
info is 'feature n works with x.y.w but not with x.y.v'.

> 2. Im guessing that your command line options dont match the original
> doom, as -nosound and -nomusic dont do anything. If so can you post a
> list of options?

RTFM :-).

> 3. On default I usually have Iphiginie running to set the matrix so
> that my sound goes out through the FDI/SPDIF instead of the headphone
> soicke. I notice that when doom starts it initialises the sound system
> and removes the clock to the FDI. Any way of keeping the FDI output
> while setting the sound as normal?

There is no way to read current audio matrix connexions, and to know which
peripheral are connected or not. On a standard Falcon, at reset, no audio
matrix is done, nothing is connected. Plus, I check if there is an
external clock on DSP port. I need more info about your SPDIF interface.

> 4. Rename doom.ttp to doom.prg and it runs at least twice as
> fast...?!?!

No idea, maybe a special ct60 features that disable caches.

> 5. Press F1 for the help screen. Another key to get to the second
> screen. Dies with the message: "W_GetNumForName: HELP2 not found!".
> This may mean that my .wad is corrupted. Can someone else check this
> out?

WAD too old, try getting the latest updated game version (1.9 for
Doom/Doom II).

> 6. Under MiNT the average load while doom was running was only ~30%

Nice.

Trouble is with the current offerings is that they're not there to buy straight off the shelf. Also, there are issues with some of the examples with irratic mouse movement and alike. Eiffel is super hardcore stuff, quite outstanding actually, but perhaps overkill for someone who just wants a reliable mouse. I'd build an IDE interface before I did one of those. I think you also lose your Atari keyboard too. Quite alot of unnecessary components on that schematic, quite power hungry too on a little ST.

Good, very good! I hope you're already thinking about a way to sell your adaptator worldwide. Well, at least to let it go through the tunnel, just for me. ;-)

My optical mouse must be around 15+ and starts to show its age, in particular its special mat is rather worn out and I have a spare optical Logitech that would fit well with my Hades. A plug-and-play adaptator is all I need.

I hope there is some way to use the wheel of the mouse. That the thing I miss the most when I go from my Linux box to my Hades.

See ya,

Would like to use USB actually now, not sure if the protocol is the same as PS2 though it must be since you can get PS2-USB cables.... PS2 looks a bit to wide on the plug (is on my mouse anyways) so will have problems there unless the plug is filed a bit..... USB fits nice under the port area along with the PCB..

Yeah, Even though I was all for using chunks of the code, I feel as Alison
said it would be best to actually write the code bottom up, then at least we
know 100% whats going on rather than trying to debug pages of someone else's
code..... Sorry coda we are gonna re-invent the wheel..... mabe get some
new spokes and a good polish for it too ;-)

Problem is with the wheel , there is nothing in GEM to support it, so there is no use in making a adapter to support the wheel..... after all, all the ST has is up,down,left,right,fire..... where are you going to put the wheel data ? Even is a way was molished to get the data into RAM, it would need someone really clued up on GEM to be able to read these values and in effect press the UP and DOWN key on the keyboard..... assuming TOS404 (or whatever) when pressing the arrow keys alters the window pos..... So sorry its not gonna happen, I would like to use the wheel aswell TBH... will keep it in mind.... dont forget this is only a simple adapter, it could be possible with Effile with some mods, but molishing a project like that is far dar down the line..... and would still need patches to GEM........

You are correct! I checked the continuity of F2, and the fuse is
blown. I have it jumpered temporarily until I can find the
microfuse. I'll be very careful with it :-)

I live in a small town, so I'll probably have to search the internet
electronics suppliers for it. Thanks for your help!

I use to run Net-Tamer on my Falcon using the FalconSpeed 286 board.
Before we finally got a PPP Atari solution to Web Pages.

Not bragging, but I think I was the first to try that and get it working
on
the Falcon.

It worked really well, speed was fast. Up to 57600Baud using the Falcon
modem port in DOS.
Net-Tamer had or has just about all ya need. E-mail, News, Web, etc.

Never could get Win 3.1 to work with the Falcons Modem port.
I don't think it was supported. Not that I used Win 3.1 that much
anyway.
Running DOS was Cool, alot like using SpartaDos on the ole 8-bit Atari.

I still have my old 80+meg Conner IDE setup to run FalconSpeed and
have 2 FalconSpeed Boards.

Net-Tamer would run on just about anything. I think there is even a pre
286 version.

I have a SuperCharger too, just about bet it would work on it. Would
like to find
a 286 or better upgrade for it.

Haven't tried the 386 version on my Vortex 386SX in my MegaSTE yet.

I sent in the registration fee for the program.

Have there been any updates in the last 2-3 years?

Tell ya Dad to run it on a Falcon for some real Fun!

>values and in effect press the UP and DOWN key on the keyboard

With MiNT and XaAES you can use mouse wheels. And for MagiC there is a
little tool from Armin Diedering which implements this into GEM.

So if the mouse wheels are supported in GEM, then how is the data processed
from the wheel to GEM ?

Some mice will recognise whether they are plugged into PS2 or USB, and act
accordingly.

Eventually things will drop PS2 support, just as RS232 was replaced by USB.

im all for wheel support, dont get me wrong! Though I can't see how GEM read
the data from the port, AFAIK you only have the 6 data lines......

The only way which it *could* work was if you use UP & DOWN and the same
time for a wheel up pulse, and LEFT & RIGHT for a wheel down pulse.....
though of couse GEM would have to read those values in and act accordingly.

if anyone knows how GEM reads the data, or can delv into the wheel code, and tell me how its reading the data from the port then that would be a BIG help..... unless I know HOW its reading the data then theres nothing I can do!

Chris

I believe, if I'm not mistaken, that MINT supports a wheel mouse, so it is
something to think about, even if its further down the road.

hmmm, I aint clued up on things these days, is MINT MultiTOS ? Whatever
supports wheelmouse, well I will need a copy of it, in fact if I have wheel
mouse support I might just plug some values into the port and see what
happens... if there is a patch of soemthing to get it working on my falcon
then please send me a copy, can't do anything if I dont have a OS which
supports it......

cheers

MiNT (FreeMiNT today) is not MultiTOS, but it has basically the same
functionality. You can get it at http://sparemint.atari.org.

There are various ways. The Milan VDI supports wheels, and have
vex_mwheel() (or some such called function) which things can use to get
wheel events. On other machines (other VDI's without this support) I hav
no idea how wheel data reach GEM, but I have a hunch drivers hook into
VDI trap vector and implements vex_mwheel(). XaAES have very good
support for wheels. I think building a new adapter like this needs to
include wheelsupport ;-) If you ask for help with software, I'm sure
someone will help you. I can help with low-level MiNT drivers to make
XaAES take good advantage of it.

Best Regards,
Odd Skancke

aye, ive looked at that before and aint got any clues whatsoever to set that lot up. Plus not everyone us using it so there wouldn't be use in making a adapter run with that little lot.

To refocus, I think first we need someone to track down the code which is controlling the wheel, then we can take a look into getting the controller to provide those data inputs..... Plus I think it would be a good idea if then someone wrote a small patch just for generic GEM, to add in that option..... I will help develop the hardware side of things but I dont have *that* much time to get into the software side of it aswell.

Like I said a UP/Down press would be the only way to pass the data though, I am not sure how GEM would react to that, hopeing that it wouldn't do anything, as such a small patch to check for that sequence of events and press the down arrow key. That would be the easy solution. Though like I said someone else would have to develop the software patch first!

I think for now is get a generic kit up and running, if enough people support the project, then it would be worth spending a bit more time into looking into the wheel and maybe other things.

The way I see it, if I'm sure Effile supports the wheel ? it interfaces direct to the MB, it would be easy to recode the mouse wheel data to push the up or down arrow key on the keyboard... Though Remember this new project is *not* a keyboard one.... I think this is where the confusion is comming from.

Its *not* the Effile project for mouse and keyboard, its a smaller project *just* for the mouse. As such I don't think it will support the wheel, just not possible without a lot of work. I think if people want to use the wheel then they would have to consider using Effile..

The project at the moment is to interface a PS2 mouse to the ST without having to do any case mods, change the keyboard, or "mess about" in anyway.

If ppl only want to use a new mouse, (which I do) then , if enough sell to fund future developments (which I doubt will happen) then we will look into other things.... Though I think anyone who wants to use the Mouse should use Effile and do all the needed mods etc.... If there is enough demand for Effile in the EC/UK Then we will look into building up some of those.... I dont think the PCB layouts are avaliable so in order to design the PCB there would have to be sufficient demand.

Hope this clears a few things up.
Chris

3211. Re: EtherNEC/Cartridge port

This sounds like my problem! The EtherNEC worked on my TT fine. When I moved it to my CT60 it stopped working. CT60 won't boot with the EtherNEC installed. And my TT is in storage. Wish I had room to have all my Atari's setup.

Besides jumping the fuse, I have no way to test to see if it's blown. Do the micro fuses change in color? Meaning give a "blown" look like normal fuses. It looks like the fuse in F1, so I can't tell. I must need glasses now..

Neodesk and the CT60 appear to not get along very well.

Geneva does run via the CT60, but for some reason slows the system down
so that Geneva on an accelerated Falcon feels about the same speed as
on a stock Falcon. I do not know why this is the case.

Galen

3213. Re: CT60 SCSI issues

Source record: 12140

Early indications are that the SCSI chain is not sufficiently stable without the external hard drive being on. With the hard drive on, everything tested thus far appears to work.

I'll do more tests as time permits, but who among us has SCSI problems when items in the chain are off? I've heard of this, but have never encountered it before.

Galen

Your problems seem a lot like the ones I've had in the past.

Run the modified control.acc with the ct60 config cpx and NVDI 5 first.
Also, find out what kind of ST RAM card you are using -- this could be
the problem as the CT60 is pretty sensitive to ST RAM.

Are you using HD driver or Cecile?

FWIW, my problems turned out to be a questionable 68060. Even thought
Rodolphe sent the original CPU to me, the chip was not stable at 66Mhz.
A new 68060 solved that problem.

ST RAM tests out fine, ram normal ram tester for that. I have NDVI4 or 5
upgrade (legit copy) but I can't find the actual NVDI install disks, unless
NVDI is freeware to download then I can't try it :(

3220. StarCommander equivalent for .ST floppy disk images?

Newsgroup: comp.sys.atari.st
Date: 2005-08-02 22:56:23 UTC
From: Chris <thisisjustadummy@dummy.com>
Message-ID: <dcotlh$4fg$1@lnx107.hrz.tu-darmstadt.de>
Source record: 12147

Asking questions again...

Is there an editor for .ST floppy disk images available to run on linux or windows? What I am looking for is a tool that enables me to add files from my pc harddisk to a .st disk image, just like StarCommander does for the C64.
If there is no such tool, is there an emulator that allows to access files and/or folders in the host file system, as well as writing to disk images (which would be a workaround for the problem given above)? Linux preferred.

Thanks for any help,

Chris

> need glasses now..

You can measure only with multimeter these +5V on romport
That dumb fuse had no display

(Solder an resistor of 350ohm and a LED after fuse) ;)
(Cheap display) :)

Check out pin 1 + 2 on romport, both should have +5 Volt
pin 38 + 40 are GND both

If your romport card woni¿½t work after replace this fuse, ask the
developer to check the timing to access this card. My CT2 woni¿½t also
accept the romport interface from elmar hilgart.

Elmar modified the software card driver so this interface work with CT2
falcon.

This is a termination problem, and the hard drive might cause it. The SCSI specification says that a drive that is switched off must not cause any problems with the SCSI bus. With your drive this appears to be different.

An ST image is not compressed, its just a straight image of the disk, sector by sector. You may be able to mount it as a loopback msdos format floppy disk on linux. I havent tried this myself though. FYI You can use dd to write the image back to a 720k floppy (if you have any).

Coda.

Coda, many thanks!

I did not try exactly what you suggested, but your hints were very helpful
in finding the following solution:
I created a (new, blank) 720k standard (IBM) floppy disk image with
WinImage, which works very well with wine on linux, put the files I need in
it (also with WinImage), saved the image file, renamed the file extension
to .ST and "mounted" it in hatari. Works perfectly!
Thanks also for the hint to use dd to write ST images back to physical
disks. I will try that later.

Thanks again,

Chris

IIRC, the standard says "should" and not "must" - most devices behave fine
when powered off, but I have seen at least two that reproducibly cause
trouble when powered off - one was the ST296N harddisk, and I do not
remember which the second was.

Is there any Atari app that will decode rar files - preferably in
TOS or MagiC and not MiNT?

Regards, /Peter/

3233. TeraDesk 3.60 is available

Newsgroup: comp.sys.atari.st
Date: 2005-08-04 12:20:47 UTC
From: vdjole@EUnet.yu
Message-ID: <dct16sres1@news.eunet.yu>
Source record: 12010

Version 3.60 of TeraDesk open-source desktop is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

TeraDesk is currently the only open-souce desktop available for 16-bit
and 32-bit Atari computers. Developers' goal is to maintain TeraDesk as
a small, simple, fast and reliable desktop, which can run on any TOS-
compatible Atari computer, clone or emulator and which can be be functional
and competetive in the modern multitasking environments and all flavours
and versions of TOS-compatible operating system(s), while keeping, as
much as reasonable, familiarity with the original TOS desktop.

Several new features have been added since the last published version,
mostly in the areas of handling file attributes and access rights, and
manipulation of desktop and window icons. Also, some bugs have been fixed.

Users are advised to read the documentation before running the program ;)
Some features of TeraDesk may not be immediately obvious.

Have fun.

Hi Rob,

> We tried to get a development system to port MiNT. Genesi promised a
> development system. They asked for the address to send the system, they
> NEVER sent one.

If you speak about development system you speak about not pay the full price? As far as i remember, the computer based on the pegasos board was planed as an amiga clone. If i look at the homepage of genesi, the computer based on the Pegasos II board was offered as a linux pc and MorphOS was also running. I have the feeling that the market was a little bit to small. Maybe genesi think, they cant sell enough systems as Atari clones to get the money back they spend in a development system?

Can you give me some information about you plans to porting MiNT? It looks like a different approach to get a Atari system running than my idea. For the first step a had different ideas to save development time.

> The Pegasos was in our minds the best option to get new hardware.
> ...

Thats the reason why i prefer to use an existing board. But in better english :-) And the Pegasos II still exists, developing new hardware will also need time. You had to wait again years (look at the coldfire) to get a PPC board.

I have send a email to bplan. Maybe it is more easy to talk with bplan. But i am afraid that i have to by my development board. But i can save transportation costs because bplan is only 25 km away from my home :-)

Regards
Michael

3244. Mega STE Hard Drive problem

Newsgroup: comp.sys.atari.st
Date: 2005-08-05 13:43:32 UTC
From: Phil Graham <grazey@tphf.karoo.co.uk>
Message-ID: <6l-dnTxRpOph8W7fSa8jmw@karoo.co.uk>
Source record: 12021

Hi,

I own a 4mb Mega STe running 2.06 TOS.

However my hard drive (a Seagate ST32155N 2.1gb) connected to the ASCI port fails to boot now.The drive was formatted with HDDriver v8.0.

The drive does 'whir' up on power up but does not boot. The HDDriver software finds the ASCI device but no Hard Drive.

Firstly.. is the hard drive beyond saving ?

Secondly is there anyway of recovering the data using a PC ?

Cheers
Phil

Phil Graham wrote:

> The drive does 'whir' up on power up but does not boot. The HDDriver
> software finds the ASCI device but no Hard Drive.

If finds the device, but no drive? Can you elaborate? Do you mean that
something like "ACSI 0.0" is reported, but the drive name is missing?

> Firstly.. is the hard drive beyond saving ?

Do I understand it correctly that this drive worked before, and even
though you did not change anything regarding your hardware setup it does
not work anymore? If this is the case it sounds bad. But maybe it's just
a broken cable. If the device is recognized, but the name (only a few
bytes) cannot be transferred a broken cable can easily cause that.

> Secondly is there anyway of recovering the data using a PC ?

I doubt it, actually my experience is that it is even more difficult to
recover anything with a PC because the more low level access is required
the less you can do it with a PC. If a device does not report its name
anymore there is something fundamentally wrong.
But nevertheless it's worth a try: A PC running Linux should be able to
access the TOS-compatible partitions of this drive if they can be
accessed at all.
Ensure that under no circumstance anything is written to this drive. If
data are garbled while being transferred trying to write something will
make things even worse.

I'm using the ACSI interface which is inside my Mega STE.

>
> If finds the device, but no drive? Can you elaborate? Do you mean that
> something like "ACSI 0.0" is reported, but the drive name is missing?
>

When I click on Device check it says "Bus 0: Atari ACSI". But if I try
Format it doesn't list any devices.
The drive worked until yesterday. I then installed a new Power Supply Unit
(Atari's own) into my MSTe.
As I mentioned, the drive does power up ok.

In this case it simply must have something to do with changing the power
supply. Either the new power supply does not work correctly or something
was broken when installing it.

While on the subject of Mega STE Internal Hard Drive,

I've a few questions.

I have a Mega STE TOS 2.06, 4megs High Density Floppy Drive and
Internal Hard Drive using the Factory hard drive hardware.

Actually, due to lack of space at the moment, I've not used it that much
and is
in storage. But I plan on setting it up as I move stuff around.

My questions are these.

Will the internal Factory Hard drive hardware support more than one SCSI
hard drive, if I can make room inside the case? Using HD Driver?

If so, what starting version would be ok to run it like this?

(Reason I ask, my original new version of HD Driver seems to be damaged)
(I've never used it or installed it before) Going to check it on another
system
to make sure that it isn't my floppy drive.

And, can I run 2 scsi drives on the Factory hardware and also use a few
more
drives like another SCSI, CDROM/CDRW using a ICD Link II or a Link 97?
(I have both devices.) on the DMA port?

Since I have a Vortex 386SX board installed, I'd like to use it with DOS
on a small
SCSI on the Factory hardware. And have another SCSI drive just for TOS
stuff.
Possibily choosing which drive to boot from on start up if possible. If
not, it isn't
a big problem. I've the manual to guide me on setup.

I want to experiment with Terminal Programs on the 386SX such as
Net-Tamer
and a few others, and since the MegaSTE has 2-3 modem ports it will be
fun for me to see what I can get running on those ports.
I have a CD here called (So Much Modem Madness 2) with over 6000
programs, mostly in DOS stuff. I've had it for along time and would like
to
see what I can find that will work.

However, I have wondered if HD Driver does increase the size of the DOS
Boot
partition, and DOS partitions with PC hardware emulators like the Vortex

386SX
and the FalconSpeed 286 board. As the boot partitions are abit small.
However, with FalconSpeed you can access fairly large partitions even
Tos ones
if memory serves me correctly. But I've not much experience with the
386SX Vortex
yet.

Another question thats probably be asked alot, but I can't remember the
answer.

On A MegaSTE with Factory High Density Floppy Drive, If I connect a
second floppy
drive, whether it is a DS/DD or a 1.44 High Density Drive. Will the
MegaSTE setup for
the right drive, or do I need to change a setting in either software or
inside with a switch?

Can I just plug in any drive such as a 5 1/4 Floppy 720K IB Drive, DS/DD
or High Density
and the MegaSTE will know whats connected? (I hope this is the way it
works).

I know HD Driver is Good. However I have the original English MegaSTE
system Disk and
Atari Advanced Hard Drive software for the MegaSTE.

I have heard that the internal hard drive hardware can be touchy. So
should I use the Atari
hard drive software thats was for the MegaSTE hard drive or go with a
version of HD Driver?

Another question, Is the MegaSTE limited to 19200 Baud or can one use
HSMODEM7 to get
better speed out of all the modem/serial ports?

And if HSMODEM will work, is this only program available to gain those
extra speeds?

It has been awhile since I setup a good Atari from scratch. So I need a
little refresher on
these things.

Any help is most appreciated.

BTW, Any one have a very clean working MEGA STE keyboard for trade?
My MSTE looks like new, but the keyboard is abit yellowed.
Contact me if ya do.

Thanks,
phantomm@bellsouth.net

No, it won't. You need another host adapter for this.

> (Reason I ask, my original new version of HD Driver seems to be damaged)
> (I've never used it or installed it before) Going to check it on another
> system
> to make sure that it isn't my floppy drive.

Registered users of course get a free replacement by email if their
binaries are damaged.

> And, can I run 2 scsi drives on the Factory hardware and also use a few
> more
> drives like another SCSI, CDROM/CDRW using a ICD Link II or a Link 97?

Yes, you can use up to 7 devices with the Link97, but you have to ensure
that the cables are short if you actually want to connect so many.

> Possibily choosing which drive to boot from on start up if possible. If

The HDDRIVER manual contains information on how to boot from different
partitions.

> However, I have wondered if HD Driver does increase the size of the DOS
> Boot
> partition, and DOS partitions with PC hardware emulators like the Vortex
> 386SX

With HDDRIVER the TOS (!) boot partition may be as big as any other
partition, but HDDRIVER cannot lift any restrictions your PC emulation
may have.

> Another question thats probably be asked alot, but I can't remember the
> answer.

There are search machines for newsgroup searches. Actually a lot of the
questions asked here have been asked and answered many times in the past
;-).

> I have heard that the internal hard drive hardware can be touchy. So

The internal drive is a hard disk drive like any other. There's nothing
special with it.

Thanks for the info Uwe,

I originally bought HD Driver 6 New, Still have the original card and
serial number.

I bought a german version of HD Driver v. 8.04, Have original disk and
manual with
serial number on disk label.

If I e-mail you the serial numbers, will that be enough to get a version
8.04 thru e-mail?

I could scan the original version 6 card and send it, or just e-mail, my
name, address and
etc along with both serial numbers.

HI there

I'd have thought there'd be a driver /ancillary application setting to fix
that. Boot using a floppy based driver and look for switches

I have HDDriver 8+ but that only protects the root and boot sectors and it won't even do that because it's saying that drive C is write protected. Can't find any other setting to fix the problem. I'm on an STe with TOS 2.06 and 4mb ram.

3265. IDE data transfer rate

Newsgroup: comp.sys.atari.st

Hello,

On my FalCT60 100/20 MHz, with an IDE HD capable of 100 MB/s transfer
rate and a CD burner capable of 7.2 MB/s, with HD-Driver 8.13, the
actual transfer rate is only of 2.5 MB/s, though the rate displayed
during boot is 6.3 MB/s (CT60 utility rev. 1.03a from march 2005).
Is my Falcon faulty ? or, do they all behave the same way ?

Thanks,

Jean-Luc

I think this can happen due to disk errors. It depends if the disk has
the S.M.A.R.T stuff or not. Someone else might be able to confirm
it. I know if Linux (I know, a bit higher level) detects errors it
immediately remounts the filesystem read-only. What's to stop disk
manufacturers from doing this low level on critical errors, in order to
protect the integrity of the data.

Thanks,
Mark

I think mine does something similar to this. I tested real write
operation with filesystem overhead and everything and it too was somewhere
around 2.5MB/sec. Perhaps there's a bottleneck inside freemint or TOS?
I'd love faster disk throughput. A real 15-20MB/sec would be a dream.

Thanks,
Mark

I have a few issues of Current Notes, but not the ones you need.

I remember Dave sending them to me free along with some 8-bit software
that was fairly new at the time. I exchanged a few letters with him and
he has a great knowledge of Atari.

It would be nice to see Current Notes up on the Web or at least
Daves' stuff.

Also, gotta mention Ben Poehland The 8-bit Alchemist!

Have you tried running Diamond Edge or some other good Hard Drive
utilitie program
that will look for corrupted files and fragmentation?

If not, try and see if how the Data on Drive C looks.
The drive may need De-Fragmented or errors corrected.

Also, not sure if this has anything to do with your problem. But the
Cartridge Port's
default letter is Drive C. And I would think it would be write
protected since its
the cartridge port.

Are you sure your Hard Drive C is booting up online?

I have never heard of drives that write protect themselves in case of an
error. That does not mean that such drives do not exist, but I would
expect to have heard of them.

Also worth to mention that we need to load files 10 times smaller as
"modern" machines, so it compensate ;)

> would be a dream.

IMHO the bottleneck is called Videl. I have a 30 GB IDE disk (a Maxtor that was running in UDMA 66 mode in an old PC) and I made some tests on my FalconCT60 100/16 (no motherboard boost). It can reach 2.9 MB/s with Freemint when the Videl is switched off, it can easily be done with a program called Turbo Veille: you press on some keys simultaneously and the screen becomes black, giving to the 68060 (or 68030) all the machine time. Before using Turbo Veille the transfert rate was only 2.5 MB/s. You can download this program here:
http://www.geocities.com/SiliconValley/Vista/6443/t_veille.zip

See you
St�phane

Bet that sad memory is etched into too many of our minds... :-(

I remember when Software Alternative in Pikeville closed here. Bummer. I have to give the owner kudos though - he rode the Atari wave, got rich, saw what was coming, closed out and retired to Florida. I wish him all the best. Wouldn't mind hearing from him, just to know how he's doing. Sadly, I can't remember his name now. :-(

Hi all,

Zview BETA 6 is available.

I'm grateful to every beta-testers and would especially like
to thank Sascha Uhlig for his great work on the documentation (which is
better that the software itself :) and for the desktop icon.

Well, the most important news features are:

- PDF support
- Godpaint read and write
- Animated Gif
- Zoom function

Due at a G++ bug, only the FPU version are available this time :/

ZcodecLib and Zweather are also updated to match with the new codecs format.

Ciao,
Zorro

Could be, its been awhile since I have messed with the cart port as
Drive C.

It is interesting that Atari put this into TOS.
They must have had some idea for using the cart port for more than what
has been developed for it.

Anyone know if the Falcon and TT also have a Drive C for the cartridge
port?

I need a source for a few standard Falcon monitor ports. Male and
Female.

This is for a project.

I'm not talking about the VGA or RGB monitor adapters. I need the actual
ports that are standard on the Falcon.

Can these be found fairly easy from electronic shops or are these
special
ports.

If I knew what they were called, part number or something similar it
would
help.

Thanks in advance for any help.

While the Videl certantly slows things down, the biggest (smallest?)
bottleneck is the 16 bit, 16/25Mhz bus. No way around that.

Have a look at the benchmarks (ST-RAM speeds) at the URL below.
http://www.czuba-tech.com/CT60/english/benchs_eng.htm

On top of that, the IDE communication itself adds some overhead.

Still looking for a Magnavox Professional RGB Monitor that has
the LIN RGB (ST-Falcon connection), TTL RGB, VCR Button, and
RCA jacks for connecting an Atari 8-bit.

These were also made in another name or two such as Philips RGB.

I will consider a broken one with a bad tube as my tube is fine.

Contact me if ya have something that may work.

And no I'm not spending $150.00 plus at BRAVO Computers.

Thanks,
phantomm@bellsouth.net

I tried, but the sound only worked through the headphone socket. There was no clock at all for the FDI.
Earlier (pmdoom 0.45 thread) you said that there is no way to read the sound matrix. I have done some reading/coding and found that although there is no XBIOS way to read the matrix, you can still read the words at $FF8930 and 32 to determine the matrix settings. See the Atari Compendium for further details.
While testing this I think I found a bug in Iphigenie, it doesnt set the clock divider rate properly, which prevents the external output through the DSP port. This may be my understanding of the program, or the matrix itself. But I coded a little assembler that did set it properly, and then the FDI started working OK.
Are the sources available for pmheretic 0.45? I would like to take a look at the FDI code.

Coda.

In fact, all audio/video code is in SDL (cvs):
http://www.libsdl.org/cgi/cvsweb.cgi/SDL12/src/audio/mint/

The XBIOS code with external clock support is there:
http://www.libsdl.org/cgi/cvsweb.cgi/SDL12/src/audio/mint/SDL_mintaudio_xbios.c?rev=1.9&co
ntent-type=text/x-cvsweb-markup

and Didier Mequignon rewrote the Devconnect() ROM function which is buggy
when setting the external clock.

I have sent a mail to Osk 5 minutes ago about that and here his answer:

"Just tested it on the Milan with latest stuff, and it runs fine."

Maybe you use a brocken CVS version? I don't know howerver it must work
on Xaaes.

On Hades 060 with a very recent version (5 august) of XaAES Zview 0.6
seems to work very good. Browsing through a folder with 308 images
(img, jpg, gif) didn't give me any problem.

Loading a pdf file worked ok, only the text was soo small I couldn't
read the pdf.

We were talking about this, so I decided to post it for all:

http://aroundcny.com/technofile/texts/davesmall91.html

By Al Fasoldt
Copyright ï¿½ 1991, The Syracuse Newspapers

There was bedlam in Reston, Va., a town near Washington, two weeks ago. A man at the front of a conference room at the Sheraton was passing out free Macintoshes -- hundreds of them. It was Dave Small at his best. Small, the inventor of the plug-in device that turns ST computers into Macs, told the crowd of ST users at a computer fair that he wanted to thank them for helping make his unusual product a success. And he then reached into a large box and tossed $300 Spectre 128 emulator cartridges out to his fans. The crowd reacted like pigeons that hadn't been fed for weeks, grabbing the palm-sized devices as they sailed across the room. I was in the audience, returning with my wife, Nancy, from our honeymoon in the mountains. I didn't catch an emulator (somebody alongside me did a flanking maneuver and deflected the one that was coming my way), but I did get to see Dave Small and his miracles in action. The first, of course, is his Mac emulator. With the ST's screen size being larger than the standard Mac's, an ST-Mac is a beauty to behold. Two million STs have been sold worldwide, and thousands upon thousands of them turn themselves into Apple Macintoshes every day at the click of a mouse. The second was something he calls the SST. It's an ST that runs at 40 megahertz. It's faster in every way than Apple's most expensive Macintosh, and a lot cheaper, too. Dave Small is one reason the ST hasn't disappeared from the American market. The company that makes the ST, Atari, had nearly abandoned the U.S. market for Europe, but Small and a few others have helped keep interest alive here. It's paying off. An advanced ST, called the TT, is now available to consumers in this country, and the company is taking orders for a notebook-size ST, too. A pen-based ST notebook computer is expected out next year. The crowd in Reston gave the TTs that were being demonstrated there high marks. But they gave their biggest thanks in the cheers that went out for Dave Small.

I am lucky enough to have a Spectre with the 128k Mac Roms and software,
and manual. And a small collection of Mac Disks that work with it.

Have it setup on a small hard drive and it works well on my 1040STE.
I used it some, but never put it thru its full paces. It is stored in a
box at
the moment.

It's abit old now, but one can still do some cool stuff with it.

I never tried any of the Macs Terminal or Net software. I can't remember
if
it supports the modem port or not. It probably does.

Source record: 11990
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

Well, it was probably my fault. I tried to run a program on a 1040STE that was for
High Res only. After booting I lost all power to the monitor.
The Fuse did not blow. And when connected to the power, I get a humming and
sometimes a faint whistle. near the transformer. To me, that means some Caps are
blown. Or another componet. But on that side, there are mostly Caps and diodes.

If I had one with a bad tube, the power supply part along with the front power switch
will slide out of the monitor. A Cable has to be un plugged and a ground wire cut.
But thats about it. I plan on replacing the Caps and see if that helps, but my time
is limited until school starts.

I also bought a like new Mag 80 RGB exactly like the PRO model but doesn't
have the LIN RGB ST-Falcon port on the back. It has the place for it. But no
circuitry for it. Everything else is exactly the same except for the Lin RGB Port.

I Have wondered if the TTL RGB port would work on a ST-Falcon if a cable could be
made. Does anyone know?

The ports are very similar, both round, but number of Pins are different. AFAIK the TTL RGB is
for a PC RGB connection. Or maybe an Amiga connection.

I have 2 TTL RGB cables, but no ends for the ST Computer Monitor Port.
One end of the cable looks similar to a 9pin Serial port connector. The other is round and
connects to the TTL RGB Monitor Port.

The Mag Pro is a excellent monitor. Would buy a working one if price is right, or bad one
if I can make use of it. Also may trade, Have lots of Atari Stuff.

If someone knows of a similar ST-Falcon RGB monitor that will also allow an 8-bit Atari to be
connected at the same time. Let me know the make and model.

3316. Nova Graphics Card.

Newsgroup: comp.sys.atari.st
Date: 2005-08-09 03:31:22 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <MqVJe.967$Kp.146@bignews6.bellsouth.net>
Source record: 11991

I recently acquired a Nova Graphics Card for a MegaSTE or TT.

I plan on putting it into my MegaSTE along with the Vortex 386SX.

I have the manual and Software Disk. It is checked by the PLUS 32.

Looking at the board, it looks like I didn't get a full board of memory chips.

Can these memory chips still be found?

If so, I would like to try and put sockets on the board and add the extra
memory if this will work. Of Course this is a future project. But would like
the info, if it can be done.

I think I have a populated 2meg board but not sure.

Anyone know what the size of the memory chips are? 256k?

even if you do that I think the 2 GAL's on the VME card need to be
upgraded. I remember the SuperNova that I have used to be a 2 meg Nova
with a Mach32. It was updated to a Mach64 with 4 megs I think and had to
have the GAL's changed. The old ones should still be around somewhere...
Basically you're going to have an interesting time with that ;) You may
be able to upgrade the memory but will the driver recognize it or care?
Additionally, you may have an easier time finding a new ISA Mach32/64 card
that has hte amount of memory you want. They're certainly able to be
found even if it's somewhat complicated due to their age.

Thanks,
mark

The CGR was something else - Mac floppies in the ST drive. Some
seriously clever engineering going on there!

3321. EtherNAT is finished !!

Newsgroup: comp.sys.atari.st
Date: 2005-08-09 15:13:47 UTC
From: Rodolphe Czuba <rodolphe.BeurkSPAM.czuba@free.fr>
Message-ID: <42f8c8b8$0$7786$626a14ce@news.free.fr>
Source record: 11997

Hi!

We're very happy to announce that the ETHERNAT is finally finished!!! The 100Mbit ethernet part is working fine and though we have no finished driver for the USB part yet, the enumeration test by Jan Thomas shows that it will work fine once the USB stack has been written (also by Jan). For more technical details read the (soon available) news on our homepage: nature.atari.org.

Now we need to know exactly how many boards we're going to produce, because it affects the price we need to ask of you. We have done some more detailed calculations on the final price. Have a look at this:

200 orders => 120 EURO/board
150 orders => 125 EURO/board
100 orders => 138 EURO/board

Shipping costs will be added to this. The prices are including Swedish VAT (25%) and apply for all EU customers except companies that are VAT registrated in their respective countries.
For all customers outside the EU instead the following prices apply (VAT for your country will probably be added by your customs):

200 orders => 96 EURO/board
150 orders => 100 EURO/board
100 orders => 111 EURO/board

HINT: To avoid the 25% Swedish VAT within the EU, let a VAT registrated company buy all the boards for your country from us and distribute them within your country. Contact us first if you run a company and want to do this.

Swedish customers may pay us in SEK instead of EURO. More info on that later.

Now please send us an email (to "hencox at hotmail dot com" or "henrik at gildaelectronics dot se" or "torbjorn at gildaelectronics dot se") and state exactly how many boards you want. Please don't write anything else, this is not yet your order! And we want this email even from our closer friends in the atari community, because we can't be sure that you want a board just because we know you...

We know that we've already asked for your interest in this product several months ago, but we need to get a fresh picture now.

Because Rodolphe Czuba has experienced that 10-20% of all who state that they will buy a board never goes through with it, please be honest when you

write this email.

You have two weeks to register your interest (until August 23rd 2005). After that we'll post information on how to prepay us for the boards.

Regards
Henrik and Torbj&#65533;rn

3323. 68881 for MegaSTe -socket type

Newsgroup: comp.sys.atari.st
Date: 2005-08-09 19:31:53 UTC
From: Hallvard Tangeraas <inv@lid.email>
Message-ID: <42f904ac$1@news.broadpark.no>
Source record: 11799

I've been looking around for a 68881 math co-processor for my
MegaSTe, and a dealer told me they had found a second hand one,
but wasn't sure about the socketing.
They sent me the following photo:

http://home.c2i.net/w-460389/68881.JPG

This doesn't look like something that'll fit in the existing
socket, but I may be wrong, and there may be adapters available
for all I know.
Anyone know if I can use the one pictured above in my MegaSTe?

Thats a PGA. The socket in the MegaSTe is a PLCC. The PLCC has legs all
around the outside edge, not all across the underside like the PGA.
Look at the following: <http://www.ontrak.net/plcc.gif> - thats a PLCC.

Coda.

Unfortunately that's what I thought, which means I'm still on the
lookout for a 68881.
Anyone have one they don't need, or know of any good sources
where I can get one?

3327. Re: Nova Graphics Card.

Newsgroup: comp.sys.atari.st
Date: 2005-08-10 05:55:10 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <SDgKe.8334$op.6833@bignews4.bellsouth.net>
Source record: 11804

The Nova software is original version 2.61. at least from the disk
label.

Still not sure if I have the 1 or 2 meg version. If each chip is 256k,
then I
count 2 megs. With room for 2 more megs.

The manual just says the more memory you have the higher the
resolutions.

Even if it turns out to be a 1 meg version. It is still Great for a
MegaSTE.

The VME device is interesting as it would seem one could use a
different graphics card if one had the right drivers.

As for adding Memory, I have a EPROM BURNER that will copy Gals nicely
if I need that for the extra memory project and can get ahold of one.

Or with the software, it would be possible to update the Gal using a new
one.

Great little Chip Burner I have here.

My MegaSTE is mostly used for the CYBER SERIES of programs like CAD 3-D
2.0.
The addition of this graphics card will help speed along the process of
updating
those files, with GEM compatible Graphic Software. And DTP Work.

Even the Vortex 386SX may benefit as it includes a ton of drivers. Not
sure It would
work with the Nova, but with a little tinkering anything is possible.
Heck, FalconSpeed, works with Screen Blaster II for higher resolutions.
And there are some special Screen Drivers as well.

The Modem Maddness 2 CD for Dos has tons of fun stuff to explore.
BackDoors, BBS's, Terminal and Net software, Ham Radio and more.
I get a kick out of running any Dos stuff on Ataris.

I am interested in how the Nova graphics card connects to the Falcon.
All Ataris are mentioned in the manual. However no info is given on the
connection
to the Falcon. I'm sure there is a different connecting device other
than the
Mega STE/TT VME adapter. What type of adapter is used and is it
connected
directly to the Falcons internal expansion slots?

Also the MegaST is mentioned in the manual. Will the VME adapter connect the Nova
to the internal expansion slot in the MegaST? If so, that would be cool for my JRI Genlock in
my MegaST4.

My First ST was a 1040STE, and ever since, I wanted to improve the graphics modes.

Since the MegaSTe is Faster, with internal Hard Drive, Tos 2.06 and I have the hardware
to expand hard drives and CDROM/CDR on the DMA port, Onlong with much better
Video Modes for GEM Graphics Work and DTP work. Along with some DOS stuff for
Fun, I finally have a Atari STE that I've always wanted. Not meaning to brag. As it has
taken me too long to get the stuff for such a setup. But its a nice feeling when you have
an Atari that you wouldn't trade for the latest Win machine on the market. I have a
Vidi ST-12 or a VideoMaster STE that I can use on it, as well as SCAN X with a
UMAX FlatBed Color Scanner. Good Printers, Happy Discovery Cart., Spectre GCR cart,
Even a SuperCharger, And a good GoldenImage Hand Scanner. And the Midi Network
Kits with software and manual will really help to transfer files over to one of the Falcons
if all goes well. I've a ton of good ole Atari Applications and Games. No way I'd trade in
all this wealth and especially knowledge on a Win. Machine.

But I am still a Falcon Nutt, but my CAD 2.0 updates can be done on the MegaSTE now
as well as my DTP stuff which will free up a Falcon for me.

Now if I could only get my dream Falcon machine, I'm close....

But in my opinion a working stock Falcon is a dream machine, if you have
the right software and use its capabilities to the fullest.

I know I am rambling, but what the heck. If I can inspire another Atari User to
keep using his computer and find new things to do with it, then that makes me
happy as the Ataris are too good to just abandon.

For me, a new area I am going to explore is the MIDI side of the Ataris. As, I am into Video and D2D recording. I want to see what MIDI can do as there's
a ton of software out there thats FREE. Good stuff too!

Anyone in the USA or Canada have alot of SCSI Cables to sell or trade?

I need, 50 pin Male on one end that will connect to a Falcons SCSI II
port.

The other end can be a 50 pin Centronics or another 50 pin Male SCSI
connector
just like the first one that will connect to a Falcons SCSI port.

Contact me if ya have em for sale/trade.

Will also consider just the 50pin male connectors without cables.

ALso, Need some 68 pin SCSI adapters to 50pin SCSI for changing 68pin
SCSI III hard Drives
to 50 pin for easier use.

ANd or, need 68pin SCSI Cable connector on one end and 50 pin male SCSI
on the other.

Got something that might help me out?

E-mail me at:
phantomm@bellsouth.net

The Nova cards are PC ISA cards with a basic interface for whatever Atari machine you had. There are people here who have the Falcon Nova, I have never seen one in the flesh, I think its a Falcon bus -> ISA adapter basically. The TT and MegaSTe are VME -> ISA adapters. I would like to know if I could talk to another ISA card from my TT or MSTE such as my Yamaha SW60XG.

I have version 2.67 for my Hades,, but it is mainly for 68020/68030 machines.
Could use another upgrade, but I doubt if we will see it. It would be nice as
the only color resolution that operates with no error is 256 colors.

That's not true. With a 4meg card you can have a resolution of 1280x1024 with TrueColor, with a 2meg NOVA only in 256 Colors. I only have a 2meg version. :-(

>Gehard is quick to respond to questions about Photoline on the PC, he

>Atari machine you had. There are people here who have the Falcon Nova,
>I have never seen one in the flesh, I think its a Falcon bus -> ISA
>adapter basically.

Yes. That's what it is. Falcon bus->ISA plus ATI Mach64 ISA card (with DRAM or VRAM, 1, 2 or 4meg) and of course the driver software (sourcecode available).

Ok, I have wondered about using different graphics cards with the
VME device.

So, If I were to look for another graphics card to use with the VME
device it should be an ATI type card?

For example if I could write my own driver for the graphics card.
What type (model name) of card would I look for?

And of course I would want the names of any cards that would work
with the VME device that drivers and etc already exist for.

Actually, the VME device for the MSTE/TT Would be a good starting place
for a Newer Graphics Card. If someone would write the drivers and etc.

According to the manual the card will work with a MegaST, but you need
a extra part called a MegaBus adapter that the card uses inside of the
MegaST.

I have no Idea what it would look like.

Also, Can I use this Nova 32 in with a Falcon, if I have the right
connector? If so, what would the connection look like?

My Nova 32 is in a Black Box, I took a look at the main graphics chip
and
it is a ATI MACH 32. I also notice 2 socketed ISA chips labeled ODD and
Even.

Anyone know what those are for? They are dated 1994.

And after looking at the memory chips, I am fairly sure its a 2meg unit,
which is good
as that will allow me to reach higher resolutions with more colors.

According to the manual even a 1meg Plus 32 will get the following....
640x480x24bit
800x600x32K
1024x768x256

Which would be enough for me, but 2 megs should do alot better. And the
board
has room for another 2 megs of chips. The spaces and holes are there,
just looks
like to me one only has to solder them in. I have to at least try and
see. 8-)

If I can get the memory chips, it would only take around an hour to do.
I will use
sockets just in case there are problems. This is a interesting project,
one that I will
do as soon as I can get a source on the memory chips.

Have a few Items for sale.

Atari Falcon 4meg board. Like New.
Price $35.00 Firm.

Atari VideoMaster Falcon Cartridge with RGB Splitter,
Like new, with manuals, software and original Box.
Price $175.00 Firm.

TruePaint, Like new 3 original disks with original Manual.
$25.00 Firm.

Atari Falcon RGB Video Adapter. New in Package.
$20.00 Firm.

Original Atari Falcon 030 Manual package with software.
Includes....
Original Falcon 030 owners Manual,
Extras Manual for the Audio Fun Machine,
Falcon-D2D Recorder, System Audio Manager (SAM),
Breakout, and Landmine.
Atari Works Manual.
Also, comes with the original SpeedoGDos Disk software
that came with the Falcon 030.
Original Atari Works Software Disks that came with the Falcon.
ANd Original Falcon Extras Disk, that includes the Audio Fun Machine,
Falcon-D2D Recorder Software, System Audio Manager (SAM),
Breakout and Landmine.
PRICE- $50.00 FIRM

If interested in any item, e-mail me at:

It does. I recall using terminal emulators with mine back in the early
1990s. It also makes the ST's parallel port look like a serial port to the
Mac software, so you can print to a parallel printer (if you've got
appropriate Mac drivers for it).

http://aroundcny.com/technofile/texts/davesmall91.html

By Al Fasoldt
Copyright ï¿½ 1991, The Syracuse Newspapers

There was bedlam in Reston, Va., a town near Washington, two weeks ago. A man at the front of a conference room at the Sheraton was passing out free Macintoshes -- hundreds of them. It was Dave Small at his best. Small, the inventor of the plug-in device that turns ST computers into Macs, told the crowd of ST users at a computer fair that he wanted to thank them for helping make his unusual product a success. And he then reached into a large box and tossed $300 Spectre 128 emulator cartridges out to his fans. The crowd reacted like pigeons that hadn't been fed for weeks, grabbing the palm-sized devices as they sailed across the room. I was in the audience, returning with my wife, Nancy, from our honeymoon in the mountains. I didn't catch an emulator (somebody alongside me did a flanking maneuver and deflected the one that was coming my way), but I did get to see Dave Small and his miracles in action. The first, of course, is his Mac emulator. With the ST's screen size being larger than the standard Mac's, an ST-Mac is a beauty to behold. Two million STs have been sold worldwide, and thousands upon thousands of them turn themselves into Apple Macintoshes every day at the click of a mouse. The second was something he calls the SST. It's an ST that runs at 40 megahertz. It's faster in every way than Apple's most expensive Macintosh, and a lot cheaper, too. Dave Small is one reason the ST hasn't disappeared from the American market. The company that makes the ST, Atari, had nearly abandoned the U.S. market for Europe, but Small and a few others have helped keep interest alive here. It's paying off. An advanced ST, called the TT, is now available to consumers in this country, and the company is taking orders for a notebook-size ST, too. A pen-based ST notebook computer is expected out next year. The crowd in Reston gave the TTs that were being demonstrated there high marks. But they gave their biggest thanks in the cheers that went out for Dave Small.

Not trying to rip anyone off on the VideoMaster Falcon and Splitter.

It is like new. Actually, under priced. Contact B&C or Best Electronics
here
in the USA and see what you'll pay for a Falcon only version with RGB
Splitter!

I payed full price for it, much more than what I'm asking. It has all
manuals, software
even the colored filters that have never been used.

Not many of the Falcon Only versions around either.

If no one wants it at this price, I'll put it up on E-Bay and will
probably get more.

Not trying to sound greedy or trying to be an ass. But very few have
gave me anything
for free, and I usually have to pay out the butt to get the good stuff
from some on this
newsgroup. But have had very fair dealings with others here. And I much
appreciate
those folks.

I think its a fair price, considering the condition and what all comes
with it.
And I normally include a nice Bonus to anyone who deals with me.

Did you get that Fiver from Ebay in the USA or Ebay in the UK?

I notice that alot of Atari items from the UK are on the US EBAY site.

And from month to month it keeps growing.

This tells me that either Folks selling Atari stuff in the UK are
getting more
money for their stuff from us Greedy Americans or no one in the UK wants
it,
Or they feel it is overpriced.

Think I'll start selling stuff on the UK E-BAY. How about some Coal for
those
long cold Nights that are coming this winter with the outrageous Oil
Prices?

I just have to go out side and dig it out of my hillside. Put it in a
good bag or
box and sell it by weight. 5pounds, 10pounds, and etc.

Hell, I'll be rich in no time!

Heres one for you all. I met Dave online via Toad computers Atari forums. He was getting rid of a bunch of Atari computers. Really was going to give them away to anyone in colorado that would come get them. So I replied to the message and noticed the email address was something like dsmall@****.com. I thought to myself thats weird maybe its really Dave Small. So a day goes by get a reply telling me what he had to get rid of. Since he was on a large IP he had a IM program that I began chatting with him about the Atari ST. He then asks me if I know about the Spectre GCR. I tell hime that I do and asked if he was indeed Dave Small, he replies yes thats me. So to make a long story short I kept tring to get the shipping rate of the equipment and he would never get it to me. I lost contact with him and a few weeks later 2 very large packages arrived at my home. It was Dave Smalls TT030 and a TTM195 monitor. I sent emails thanking him and asked him to let me pay the shipping costs. It never happened. So the center point of my atari collection is my TT030 that was owned and used by Dave Small that he shipped to me for FREE and gave to me for FREE. What a great guy. You know I watched that thread on Toads site to see if anyone ever asked him any questions. Nobody ever did.

He said his kids were doing great and he was recovering from broken arm(if my mind serves me corretly). No longer married. But seemed like the Dave Small that everyone loved.

Don

That says it all really. Only desperate people pay those sort of
prices.

>I payed full price for it

Goes with the territory.

>Not many of the Falcon Only versions around either

I bought mine direct from Hisoft 2 years ago for £25.

>If no one wants it at this price, I'll put it up on E-Bay and will probably get more.

Very unlikely. Why would someone bid MORE than they could pay a B&C or
Best? But then, theres one born every minute.

>Not trying to rip anyone off on the VideoMaster Falcon and Splitter.
(forgive the upside down quoting)...
We know that.

> Price $175.00 Firm.

Can you explain what "Firm" means, being UK side im not familiar with
the term.

Coda.

> phantomm@bellsouth.net
>

all the stuff I sold was on UK ebay, I always offer to US, most people in the US want upgraded ST's... and yes your item is probably worth $170, though its only worth what people will pay for it, I spent around £200 on each of the Atari's I upgraded, people wont pay that much for one, so I've lost probably over a £1,000 on that lot alone, I lost about the same on the video stuff aswell... and yes I get a great loss for providing people with cheap stuff, something which I am not doing any longer.

If you feel its value is $170 then you keep it, its only *worth* what people will pay for it. The US market is a lot bigger than the UK one in some things... offer your item on global ebay, start bidding at $5 if you are lucky someone will bid, if your VERY lucky you may get a bit more. I really hope you do get the full asking price.

I paid about £200 for my VIDIST kit, its rare and should still be worth a lot, though im not even going to try and sell it, its £200 value to me

probably ?1 value to someone else. Nobody is having a go or telling what to do, but hey I would like ?500 for the my video stuff, I could wait for the next 50 years before someone would pay it, as I wanted to clear the stuff out of the way I let it all go for a pathetic ?5.... You either put it at a low $5 or be wait until someone will pay the full amout you ask, one day someone will but demanding such a price in a "or else" fassion is never going to work.

List it on ebay for $170, just remember you may have to keep listing it for the next several months if not years, the only people who are making anything is Ebay, probably $5 each time you list it, if you list it 10 times and it does not sell then your $50 down, and you STILL have to sell it then. I know this ALL to well..... its just some friendly advice which people are offering you, just be warned that holding out for the full asking price is likely to cost YOU a lot more than you will will sell the item for in the end.

>get more.

>Very unlikely. Why would someone bid MORE than they could pay a B&C or
>Best? But then, theres one born every minute.

what gets me is places like atariworkshop have listed USED ST's for like
£200, I mean who in thier right mind is going to pay that when they can get
one for £20 with piles of cables, games etc off Ebay... they have some nice
stuff which I would like though I aint paying 15 years ago prices for stuff
today!

On the other side of the coin, they probably paid alot for the stuff when it
was new and they want to get thier money back, wouldn't we all, but prices
drop and you have no choice but to follow..... in theory anyways....

>Not trying to rip anyone off on the VideoMaster Falcon and Splitter.
(forgive the upside down quoting)...
>We know that.

> Price $175.00 Firm.

>Can you explain what "Firm" means, being UK side im not familiar with
>the term.

It means he aint going to accept anything else for it, if someone offered
$170 then he wouldn't take it.

Okay, I'm desparate. :-(

I paid B&C Computervision $150 USD earlier this year for my VideoMaster Falcon, without the RGB splitter.

I guess I could have waited and got it from some place like Ebay for less money (if one ever showed up) but I feel that its worth it *to me*.

I suppose it all comes down to the eye of the beholder, eh? One mans' gold is another mans' garbage... :-)

I have substantial doubts about the possibility of using other cards. It's somewhat likely that this VME card is not really an ISA bus implementation so much as a minimum implementation to make the ATI Mach series cards work. If you need a GAL update just to move from Mach32 to Mach64, you'll need a GAL update to do much else other than video ram upgrade maybe. If you look at the ethernec for instance, it's supposed to be for Ne2000 ISA cards, but the reality is relatively few of those cards work. If you go to the store and buy a brand new netgear NE2k compatible ISA card, guess what.. it won't work. You need an RTL chipset card for the best compatibility though some others work fine as well. It was built on that RTL chipset.. I forget the digits. I'm thinking the Panther upgrade for the Mega ST might actually be a full ISA bus.

The CTPCI thankfully will be a full REAL PCI bus. Meaning some day when I want to plugin a firewire card or something, it's a simple matter of drivers... simpler than you think really thanks to linux. Hardware has always been our unicorn.

Thanks,
Mark

Well, I thank you for the kind offer anyways. Honestly, I never even thought about asking on here for one, although it should have been the very first resource I turned to.

A fool and his money, eh? :-)

Hmm, do you have the RGB splitter though? I wouldn't mind getting one of those to go along with it, for a fair price.

Source record: 11846

Hello,

This is a straight port of xmame to the Atari platform. This is an
EXPERIMENTAL release, i.e. the program may not work at all. It is sure
that if you encounter a problem, I will not be able to help you.

However, you can still drop me a mail about your experience trying to run this
beast.

Hardware/software requirements:
- 68020 or higher CPU.
- FPU.
- 32 MB RAM (just to load it), so you'd better have more than 40 MB free if you
want to load a game.
- True colour video (Falcon, or any machine with graphics card), i.e. 15, 16,
24 or 32 bits video mode available.

Mame needs some serious power.

Don't expect to be able to run much more than the original Pacman. But a
lot of old games should work at least a little.

I have 3 VideoMaster Falcons with Splitters.
And 1 ST/STE/Falcon version.
ALso have
Vidi ST with RGB Splitter and Vidi ST-12.
2 Expose Digitisers
3 Genlocks
and some other misc video stuff.

I was just trying to offer one of the extra VMF carts at what I though
it
was worth. Thats all.
No one has to buy, I'm not twisting anyone's arm.
And I really don't care if I sell it or not as I use them.

If I were out to make money, I'd be selling something other than Atari
stuff.

And I do think it would sell at a good price on Ebay. Because, I have
never seen
one on there. And most good stuff goes for a high price.

And if someone did pay my asking price, it's there business and mine.
Calling folks suckers in someone else's thread isn't right.

And really it's nobody else's business.

What was done here, is no different than going into someone's place
of business and telling the customers in there that they are suckers
if they pay that price for a certain item.

There are laws against that sort of thing. Maybe not on the Net.

I just don't get it, why try to devalue my stuff. If you don't like it
thats fine, But I don't think you have the right to come in my thread
and call someone a sucker if they buy a item from me.

I have never done that to anyone advertising an Atari product on here.

But it seems everytime I list something on here, someone from overseas
has something nasty to say about it. Fine, It goes both ways.

I can be a Big Bastard when pushed to far.

No. We have every right to say:"ppl this item can be get cheaper". No one call customers suckers. I dont mind how much one pay for a product, he has right to know whole picture, aka others prices.

> There are laws against that sort of thing. Maybe not on the Net.

There is no law for such thing. Maybe in US. U have right to set price, cusotmers have right to know they are high/low whatever...

> I just don't get it, why try to devalue my stuff. If you don't like it
> thats fine, But I don't think you have the right to come in my thread
> and call someone a sucker if they buy a item from me.

Again, u are repeating, and twist to make us look bad: We dont call anyone sucker, especialy not the customers. We have every right, to tell customers that certain thigns can ge get somewhere cheaper. If i get XX item for 20$ and sold it for 20$, i have right telling people that 200 may be too much. What they will do next, is their problem...

> I have never done that to anyone advertising an Atari product on here.

Bottom line, this place is not proper one for advertising in first place.

> But it seems everytime I list something on here, someone from overseas
> has something nasty to say about it. Fine, It goes both ways.

Oh, so now its political problem? Complain to Bush, he may drop a bomb or two. I dont mint overseas or not. I already bought stuff and send them to ppl overseas. I also bought items from US persons, never had a prob. NOTE: buying in US is exactly the same "oversea" to me as is Europe to you. I dont have problem with that. And i dont see why saying: "guys hold your horses, Falcons can be get from 100usd on in Europe. Rethink, u may get it way cheaper that way, spending extra money for add-ons.." fall in category "someone from overseas has something nasty to say..) And sending item from US to Germany or UK, is exactly the same as sending it from UK to Slovenia or Greece etc.. A tad longer, so it is not such problem as i keep hearing all the time...

All US guys bought CT60 at SAME prices as we did with overeas posting, so why not extend that to other things? Or u just have a problem with us down here if we notice ppl about something? That happens u do not like... Or u are

paranoid, and we all plot big conspiracy again US here.... This is pathetic.

> I can be a Big Bastard when pushed to far.

No need pushing, simply pointing out is enough...

Uh-huh.

Gotta love the sales technique. But then, when I was in the US, I saw
the word "Firm" in an advert for used kit, and ignored those adverts.

Dude, dick-waving on Usenet is really sad. Especially when you're trying
to sell some overpriced obsolete junk to people.

Richard

Hi,

I need this for using long filenames in the Atari emulator TOSBOX running on
MS Win 98.
Any help is greatly appreciated.

regards, Ludwig

Just my opinion here, so everyone can take it as far as it goes, but let me point out some things:

1. Phantomms prices are in range with what dealers are selling it for here in the US (and cheaper, if you throw in the RGB splitter).
2. I might have easily missed something, having been out of the Atari scene, before re-emerging in the last year but I've not seen -1- VMF advertised here, or on Ebay, until Phantomms post. So my assumption is that they are not as common as leaves falling off trees.
3. Hmm, I guess that, in some peoples opinions I paid too much for mine, but I wouldn't consider it to be obsolete junk at all. (if you do lean towards that argument, then you would have to apply it to *all* our Atari hardware and software <grin>).I mean, I use it, I like it, it works for me. Aside from that, what choices does a Falcon user have if they want to play around with recording video/audio? Not a lot, that I can tell.

One user did say that they got one for 25 pounds(?) from Hisoft in the UK. That sure sounds like a bargain to me, when its converted to US dollars but that is in the UK.

I personally have no problem with people buying/selling on usenet. It is for the users, right? Is there a comp.sys.atari.marketplace or something like that? If there is, it might be more appropriate there. Otherwise...

As I said, just my opinion and 2 cents worth... <smile>

Later gang.

True, but there is a point where common sense has to step in. If the
cost of sticking this stuff onto a Falcon outweighs the cost of, say, an
old iMac DV and a USB or Firewire video interface, then really, why
would you want to use the Falcon?

I moved from Falcon to Mac for music, because whilst there is a certain
cachet to using the Falcon, only the most determined retrophile would
insist that it was in any way better than the same sort of money
invested in newer Apple or PC hardware. The dealer prices in the UK of
around ï¿½450 for a Falcon, ï¿½200 or so for a better MIDI interface, and
GodKnowsWhat for DSP audio hardware, were vastly in excess of the cost
of a decent iMac, a 128-channel MIDI interface (by the same
manufacturer!) and good quality Audio I/O.

What things are worth, is what someone is prepared to pay for it. I'm
not denying that Phantom can pretty much ask whatever he wants and hope
for a sale, it's a free world, but getting into "I can be a big bastard
when pushed" posing when trying to sell stuff strikes me as an exercise
in futility.

Richard

Okay, I'll concede that point as far as cost goes. However, think along these lines, I'm not here because of cost. I'm not here because platform x does something better or cheaper than platform y or even z.

I'm here because I love Atari. Especially my Falcon. If it was all about cost, I would stick with my 3 comp Linux LAN & laptop, and never do anything with Atari hardware/software.

Its love of the machines, the community, and pure old nostalgia. :-)

From your viewpoint, I understand what you are saying. If I were a music professional, I would absolutely agree with you.

Its a hobby to me. Its that "for the love of" concept. The best times I've ever had, computing wise, was with Atari. I still have more fun, and get a better sense of achievement when I do things with my Atari's than I do with anything else. I was simply overjoyed when I was able to get my BBS online, available for Atari users world-wide once again. I could have done it (easier/cheaper) with a Linux BBS, but it wouldn't have been the same. I really, really like Linux a lot, for example, but its -just- not the same. I don't do "windows" at all. Never have. Never will. Atari (MINT) was my stepping stone into the Linux world. Just something else I have to thank Atari for.

So many memories...its a good fight, just keeping them alive. :-)

See ya Richard!

When i found my Falcon I was recording music on a Roland VS, and
sometimes on a PC at work. The Roland gear was nice, but the "state
of the art" PC gear was terrible, simply because it ran with Windows.
I got into the Falcon mainly because I could get the gear for much
less (a few years ago) than buying the Roland gear or similar setup

for my home studio, and I was an old Atari user from way back who had never even experienced the Falcon. It was a great decision. I love my Falcon and have continued to improve upon it. It is not only a great home studio solution, but I've had loads of fun learning Mint, adding the CT60, etc. Although I've gotten most of it for bargain prices, it is worth the price of "new" gear to me. I have an iMac G5 at work now, and I love that too, but I wouldn't say it is better than my Falcon setup for the money involved. I say let individuals post their gear here at ridiculous prices if they want. At least it stimulates some conversation and sometimes I hear about gear that I didn't know about, even if I don't want to pay those prices. If I have something to sell, I'll list it "make an offer" to help out other Atarians.

Every game I try on my CT60 falcon works but is super super slow. It's a
shame there's not special better 68k emulation that isn't really emulation
;) Especially considering a LOT of these games use 68k chips and Z80's
can't be that hard to emulate? Kudos on a good port!

Thanks,
Mark

I agree you have the right to tell folks that a item can be gotten
cheaper.

But I don't think you have the right to come into my thread or
advertisement
and say that.

If what you are saying is true, then anyone can hack into a Business Web
Page
and say Hey you can get it cheaper at XXXX.

Try doing that at some of the major Computer Business Web Sites and
see what happens to you.

>
> There is no law for such thing. Maybe in US. U have right to set

Below is a direct quote from CODA....

(Very unlikely. Why would someone bid MORE than they could pay a B&C or
Best? But then, theres one born every minute.)

End Quote

Sucker wasn't mentioned but certainly implied.
If you need the whole posting with headers for proof, it can be
provided.

If you want to tell someone here that a VideoMaster Falcon only version
with RGB splitter, original manuals, software and box can be bought
cheaper somewhere else. That is fine with me.
But do it in your own Thread. Not mine!
It is most dis-respectful to do that in someone elses thread at the
least.

I don't come into your thread and do you that way.
But if it continues, I will.

>
> Bottom line, this place is not proper one for advertising in first
> place.

I don't see why not. It is Atari re-lated and folks have been
advertising
Atari stuff in here for years.
According to you, The CT060 shouldn't be advertisted in here.

Well how the hell, does anyone suppose to find a Atari product that
they might want? Google? E-Bay? Sure you can search for items.
But if you don't even know the items name or that it was ever made,
then how else?

>
> Oh, so now its political problem? Complain to Bush, he may drop a

> say..) And sending item from US to Germany or UK, is exactly the same
> as
> sending it from UK to Slovenia or Greece etc.. A tad longer, so it is
> not
> such problem as i keep hearing all the time...

Not political, to me. Just a Fact that every Degrading remark related to
my advertising has came from overseas, and alot are from the UK.
And have been done in my Thread or Posting. Thats a Fact.

Again, I have no problem with you or anyone else saying a product can
be gotten at a cheaper price. I like a good deal myself.
I do have a problem when it is done in my thread.

If you have such info, then post where it can be gotten at and do it
in your own posting. Not in my posting, or Web Page, or place of
business.
UNDERSTAND?

> All US guys bought CT60 at SAME prices as we did with overeas posting,
> so why not extend that to other things? Or u just have a problem with
> us down
> here if we notice ppl about something? That happens u do not like...
> Or u are
> paranoid, and we all plot big conspiracy again US here.... This is
> pathetic.

Fine, do it in your own thread or posting.

Your are trying to twist my words. I never said that one could not post
or say
that a item could be bought cheaper.
I only said, that if you want to do that, then do it in your own Posting
not in
mine.

Or do you feel you have the right to go into anyones posting, Web Page,
or Place of Business and do that?

I don't have a problem with any people as a whole, I am not that way.
I do not like someone who trys to devalue my stuff in my Face.
Which was what was done.

I like getting a good deal on items myself. But I don't go into peoples
postings and start a argument over a item they have offered for sale
just because I feel the price is to high or that it can be gotten
cheaper
somewhere else.

And I am still waiting for the info on where one can get a
VideoMaster Falcon only cartridge with RGB Splitter, Original
Manuals, Software and original Box. Like New for less than
$175.00 US?

>
> No need pushing, simply pointing out is enough...

You seem to be a expert at that.

Zorro,

ZView is looking really good especially the PDF viewer. I did a lot of tests with Porthos and reported various problems to the author. ZView all ready displays stuff that Porthos struggles with.

Is the Zoom feature not implemented yet ?

Porthos doesn't work quite well with XaAES. Although much slower
Ghostview perform better then Porthos.
Zview looks promishing indeed. It's reasonable fast and can display
most pdf-files.

Oh, I have heard it before, in this group a few years ago.
When some where complaining of Sigs being to long and etc.

The subject of the Sig did come up.
I bet I have it archived here somewhere.

Not sure what the official rules for Sigs in NewsGroups are.
Would be interested to find out my self.

Anyone have the URL for reference to USENET rules?

If not, I'll search for it myself.

Oh yea, I am still waiting on where that VideoMaster Falcon cart and
RGB splitter is for under 175.00US.

I'd probably buy it myself, unless it came from the UK.

I agree you have the right to tell folks that a item can be gotten
cheaper.

But I don't think you have the right to come into my thread or
advertisement
and say that.

If what you are saying is true, then anyone can hack into a Business Web
Page
and say Hey you can get it cheaper at XXXX.

Try doing that at some of the major Computer Business Web Sites and
see what happens to you.

>
> There is no law for such thing. Maybe in US. U have right to set
> price,
> cusotmers have right to know they are high/low whatever...

Net time I'm in the UK, I'll be sure to put your knowledge of the Law
to the test. I'd like to see someone from the UK go into a business and
do that. Anyone have the guts?

Below is a direct quote from CODA....

(Very unlikely. Why would someone bid MORE than they could pay a B&C or
Best? But then, theres one born every minute.)

End Quote

Sucker wasn't mentioned but certainly implied.
If you need the whole posting with headers for proof, it can be
provided.

If you want to tell someone here that a VideoMaster Falcon only version
with RGB splitter, original manuals, software and box can be bought
cheaper somewhere else. That is fine with me.
But do it in your own Thread. Not mine!
It is most dis-respectful to do that in someone elses thread at the
least.

I don't come into your thread and do you that way.
But if it continues, I will.

>
> Bottom line, this place is not proper one for advertising in first
> place.

I don't see why not. It is Atari re-lated and folks have been
advertising
Atari stuff in here for years.
According to you, The CT060 shouldn't be advertisted in here.

Well how the hell, does anyone suppose to find a Atari product that
they might want? Google? E-Bay? Sure you can search for items.
But if you don't even know the items name or that it was ever made,
then how else?

>
> Oh, so now its political problem? Complain to Bush, he may drop a

> nasty to
> say..) And sending item from US to Germany or UK, is exactly the same
> as
> sending it from UK to Slovenia or Greece etc.. A tad longer, so it is
> not
> such problem as i keep hearing all the time...

Not political, to me. Just a Fact that every Degrading remark related to
my advertising has came from overseas, and alot are from the UK.
And have been done in my Thread or Posting. Thats a Fact.

Again, I have no problem with you or anyone else saying a product can
be gotten at a cheaper price. I like a good deal myself.
I do have a problem when it is done in my thread.

If you have such info, then post where it can be gotten at and do it
in your own posting. Not in my posting, or Web Page, or place of
business.
UNDERSTAND?

> All US guys bought CT60 at SAME prices as we did with overeas posting,
> so why not extend that to other things? Or u just have a problem with
> us down
> here if we notice ppl about something? That happens u do not like...
> Or u are
> paranoid, and we all plot big conspiracy again US here.... This is
> pathetic.

Fine, do it in your own thread or posting.

Your are trying to twist my words. I never said that one could not post
or say
that a item could be bought cheaper.
I only said, that if you want to do that, then do it in your own Posting
not in
mine.

Or do you feel you have the right to go into anyones posting, Web Page,
or Place of Business and do that?

I don't have a problem with any people as a whole, I am not that way.
I do not like someone who trys to devalue my stuff in my Face.
Which was what was done.

I like getting a good deal on items myself. But I don't go into peoples
postings and start a argument over a item they have offered for sale
just because I feel the price is to high or that it can be gotten
cheaper
somewhere else.

And I am still waiting for the info on where one can get a
VideoMaster Falcon only cartridge with RGB Splitter, Original
Manuals, Software and original Box. Like New for less than
$175.00 US?

>
> No need pushing, simply pointing out is enough...

You seem to be a expert at that.

AFAIK this is a discussion group - someone post something, the others
discuss its implications, isn't it?

Haven't read it myself in a long time, but I remember a few general
things. Like no more than 4 lines. Also, its considered polite to leave
politics, religion, etc, out of .sigs, essentially anything that might be
considered inflammatory.

Was that a RFC, "Request For Comments' document somewhere? Can't remember
off the top of my head.

I can agree with that. I have a PDF book I downloaded and Porthos shows the
text fine, but not the graphics. ZView shows everything and works great. Most
PDF's work fine except for the ones I get from my local Atari club. For some
reason the some letters are missing and I get garbled text. It is the same
under Genva. Trying to figure out what the problem is.

On my spectre GCR page I have a list of programs that I have tested. The Spectre could only run System 6.08 (as high as that is) and the serial port worked perfectly with like Z-Term and ones like that.

I never had much luck with the System 6 version of FreePPP or the system 6 internet browser. Sadly Spectre seems to only work about 80% with most System 6 stuff. What is funny is that SoftPC for System 6 actally worked, and so did the Apple II emulator. :)

Playing Spectre on a Spectre was always fun. :)

3403. Update on Atari - PS2 converter project

Newsgroup: comp.sys.atari.st
Date: 2005-08-14 12:05:30 UTC
From: techie_alison <techie_alison2000@yahoo.com>
Message-ID: <ddnc29gmb1@nwrdmz02.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 11877

Hello :-)

Have been reading through the posts on here and thought it was time to answer some of the queries directly.

RE: Wheel mice and Eiffel
I would suspect that this works via Eiffel as the entire keyboard MCU is replaced, therefore allowing the additional 'super' features of the PS2 mouse to be realised. It is likely that these are represented as regular keystrokes which are interpreted by a software driver and then represented.

Without replacing the keyboard controller and opening up the case or de-standardising the ST hardware, there is no possible way to use anything other than LB/RB/XA/XB/YA/YB.

The only short-cut hack possible would be to have the third button act as either a double-click motion or to 'hold' onto a paned selection when dragging until it is pressed again.

RE: USB support
At the moment that's a no-go. USB is inheriently a substantially more sophisticated standard than is realised among the masses. That's not to say that it isn't possible. A third party bolt-on is currently required to interface USB to programmable interface controllers, thus pushing up the price with little gain other than novelty.

RE: USB vs PS2 lifespan
It's unlikely, very unlikely that we'll be seeing the back of PS2 anytime soon. The main issue that I used to have with USB hardware in a support role is that the equipment isn't recognised until after an O/S is used. For example, if there was a laptop with a malfunctioning keyboard and there were no PS2 ports to connect a desktop unit it was back-to-the-manufacturer time to find out that it was a corrupt bios that had caused the problem. All very unnecessary and further control being taken away from the user.

Saying that though, laptops are now shipped without COM or LPT ports. Overall I feel that the consumer is getting a bad deal in the interests of manufacturers pushing for change that is supposedly better. Might lower costs perhaps, but there's going to be alot of mighty useless computer equipment in the future. Certainly not my idea of environmentally friendly. We are all here on this newsgroup afterall, supporting a computer (Atari) which is 20 years old and still perfectly usable.

RE: PS2 mice which are supported by this converter
ALL PS2 mice are supported in standard X/Y/2 button mode. This is the default mode for all mice, even super-charged ones with jet engines. There are specifically 2 type of mice which are endorsed here, the Microsoft Optical Mouse, and the Logitech trackballs. Regular balled mice are perfectly usable although suffer from the reasons which pushed us to buy optical mice in the first place.

RE: Tracking speed
The PS2 converter tracks faster than the ST mouse, at approximately twice the speed. Also, movements are not misinterpreted should the mouse be moved exceptionally fast across the desktop, as occurs with the original Atari STM1 mice. Why anyone would want to do this is anyones guess.

RE: Future inclusions to the project
It has been discussed between myself and Chris, to add support for the Commodore Amiga since this is just a case of changing the ports in the chip doing the conversion. Another idea is to enable the tracking speed to be changed. These options would be set by for example, pressing both mouse buttons within 2 seconds of interface-power-on. Pressing the left button would toggle Atari/Amiga mode, pressing the right button would toggle between 1 report/mm, 2 reports/mm, 4 reports/mm, and 8 reports/mm, pressing both buttons again would leave the configuration mode. These settings would be saved into EEPROM on the interface chip, and be read automatically thereafter on power-up. The aim here is to add some form of setup for the user in a way which will never interfere with the funtion of the interface.

RE: Firmware/software development progress
The interface firmware/software is now coded and functional. It is completely transparant, and once plugged in the PS2 mouse just works as you'd expect, in that you can leave the computer for 24 hours and come straight back to it and it's working. The interface has so far been tested on an Atari STFM and a Mega STE/TT style keyboard. All STs right across the range use the same keyboard controller chip so no issues are percieved from STF thru to TT.

RE: Hardware development progress
There are no external supporting electronic components whatsoever, just the interface chip. This is deliberate, to cut down on quality issues. As Capt. Scott of the Enterprise said, "The more you overwork the plumbing, the easier it is to block up the drains."

OK, that about wraps it up here really. The next stage at our end is to have the PCB's manufactured and put a few together ready for sale, direct PayPal will be the chosen method of payment, eBay may be used but some reservations about that. In retro tradition, it is planned for an A4 flyer/thing to be put together describing it. Planned cost is about £15 for the complete interface. OEM sources of MS optical mice (the red LED ones) have been found, with the price tag being about £15 for one of those also, being careful with those actually so not to rip anyone off although the street price is some £25! which I do feel is a total rip

off given that you're paying for packaging that's going straight into
the bin. So, no packaging, just the wrapping they come in.

As for the next project, we're open to suggestions. A simple Atari - CF card interface is being discussed although some difficultly in sourcing the low-level interfacing, have to understand it first. The plan with that would be a small box that plugs straight into the AHDI port and draws it's power from the signal lines, only just possible perhaps, but hoping as the mA consumption would be so low. No further discussion on that however as that red-herring has been thrashed out over and over again on the forums with no results.

Aly, and Chris/Exxos, speaking for you here Chris ;-)

TOSBOX with access to long filenames would be sufficient for me at first. It
is far more compatible than aranym and with TOS206 it runs faster than
aranym with TOS404. With fvdi aranym performs better, but then even less
Atari Apps run.
I also find TOSBOX more interesting because I've created an Atari Boot disk
for x86 PC's with the free Caldera DOS, TOSBOX, a TOS Imagefile and some
Atari system essentials and would like to continue development of this Boot
disk.

That's not the point! Rudolphe AFAIK never wrote, that someone hasn't
the right to come into his thread/advertisement and say what he think
about his proposal - that's the difference!

> If what you are saying is true, then anyone can hack into a Business
> Web Page and say Hey you can get it cheaper at XXXX.

UseNet != Business Web Page

> But do it in your own Thread. Not mine!

You've no own thread - if you want your own thread: use WWW!

> I don't have a problem with any people as a whole, I am not that way. I
> do not like someone who trys to devalue my stuff in my Face.

That's suggested: you've only problems with any kind of people as far
as they don't agree with you, isn't it?

Maybe, just maybe, due to differences and since u are far away, and
bombed with own views, u need a view from a side (here we step in) and
thats why generaly u hear complains from our side... BTW, i live far from
U.K.

> I do have a problem when it is done in my thread.
> If you have such info, then post where it can be gotten at and do it
> in your own posting. Not in my posting, or Web Page, or place of
> business.
> UNDERSTAND?

Whohoo! CAPS! Btw, this is ridicilous: This is public forum and topics
as well are public. So, u propose that each time some on has a remark on
something (as we did on prices) new thread is opened. And then if someone
will have remark on something in new thread, new will need to be open? ;)

> Or do you feel you have the right to go into anyones posting, Web Page,
> or Place of Business and do that?

Hey, ones can invade contries and other can not even comment postings
in c.s.a.s ;) Be sure, that if i will sell item for XXX$ and u would say
it is expensive i will not get upset and even try to excuse that as invading
into my thread... But to be honest im long on scene, like Atari stuffs and
most i either get or give via exchanging or VERY cheap policy, esp in those
times where we are little, we need to take care about community. Personal
goals are, imho, less important. That is the "scene spirit", not giving away
goods at big prices "as i like to offer them to fellow Atarians instead eBay".
U say u like good deal, we all do, sell on eBay, no problems...

>> No need pushing, simply pointing out is enough...
>
> You seem to be a expert at that.

U posted, we comented, u went berserk. Think about that. U used political
sign, u started to go inpolite. Think about that too. I guess we poked in
right spot.

Never said that. This has to do with having respect and being
a decent responsible USENET user.

>
>> But do it in your own Thread. Not mine!
>
> You've no own thread - if you want your own thread: use WWW!

No, I don't own my own thread. Never said that. But it was just
a advertisement. If you or anyone did not like the price then
at least thats all that should have been said. And if there is
anywhere were it could have been gotten cheaper it should
have been posted.

Instead, I was insulted. Which anyone has the right to do.
But it shows everyone reading this thread what kind of
person you are.
I know that I will never buy anything from or have anything to do with
the
people who started this. And the ones that keep it going.
Which probably will not hurt anyone in the least. But remember
this. When you post here, Expect the same treatment that you
have shown to me.

If I came into your posting and insulted you in this newsgroup would
this not upset you?

Still there is no mention on where the item I had for sale can be
gotten at a cheaper price.

Instead, there were just some people who wanted to start a Flame War
and thats what they got.

I have nothing more to say about it. Insult me all you want. If thats
what
makes you guys happy.

But it goes both ways and it will.

3420. Done it again... :-(

Newsgroup: comp.sys.atari.st
Date: 2005-08-14 21:20:16 UTC
From: "Ronald J. Hall" <dark_lord@charter.net>
Message-ID: <pan.2005.08.14.21.20.15.717278@charter.net>
Source record: 11897

Well guys, I'm beginning to believe that I'm incompatible with TOS computers anymore. :-(

I've been having some problems with backing up data from my BBS (one burn works, 2 don't, 1 won't, 3 will, etc,etc,.) via a SCSI Plextor CDR. So I decided that I would upgrade from HDDriver 7.0 to 8.1. (I'm already using the latest version of Anodynes' excellent ExtenDOS software).I figured it was time to upgrade anyways.

So from a running system, I deleted everything in the HDDriver folder on C:, then copied in everything v8.1. I then ran the utils app. It ran. I located hddriver.sys. It complained that it was an older incompatible version. So I used the install option. This seemed to work, it just gave me a message afterwards that I needed to reset all my options afterwards.

So. I looked at my settings. The device check found all 3 of my devices on the SCSI chain. However, it would not find any partitions. Or let me pick anything that would let me look at them.

Somewhere from in the foggy mists of my mind, I seemed to recall that at some point you have to reboot with HDDriver to get everything going. So I did that. Ooops. No go. The bootups says this:

HDDriver info
No Partitions Found
Some amount of memory allocated

and a lo-res TOS desktop with an A, B and trash icon. Thats all. Installing a C icon and clicking on it only gives a "no such partition" error.

Note that this was *without* the HDDriver floppy inserted - so it had to have run from the hard drive, right? Tell me I'm not crazy on this point.

Anyways, so I inserted the HDDRiver v8.1 floppy, rebooted, and I get the same message as above. No partitions found, blah, blah, blah. So I run the HDDriver utils app from the floppy drive. It runs. I pick the scan for devices option. It reports this:

Device check:
Bus 0: Atari ACSI
01.00: Seagate ST 34555N 0930 Direct Access
02.00: Plextor CD-R PX-R412C 1.07 CDROM/Recorder/DVD (approx)
03:00: SyQuest EZ135s 1.17 Direct Access

So it finds the hardware. I then try formatting (just for testing purposes, I really, really don't want to reformat or re-partition),

partitioning, trying to locate HDDriver.sys, nothing. No selector boxes ever shows C as active, its always greyed out.

Some specs., its a Mega ST4, TOS 1.4, 4 gig seagate HD, Plextor CDR, Syquest EZ135 cart drive, and it was all a solid, no errors running system with HDDriver v7.0.

I used this same v8.1 floppy disk to install HDDriver on my Falcon, but I don't remember having these problems at all, except for having to reboot at some time to get it to show up the partitions.

So. I'm stuck without a Mega ST to run my BBS. Can someone tell me how to get HDDriver to find my setup again? How to do this without losing approx. 4 gigs of data from my BBS? Tell me what I did wrong so I won't do it again (I promise!). :-)

Thanks everyone.

Oh I loved Codeheads!! Especially Warp 9 and the fortune cookie program.
That was awesome!

As for Dave Small, when I wrote and put up the Spectre GCR site, Dave said
he liked it, had a lot of fond memories of the Spectre, and was going to
offer me the code for Spectre 3.1, but that never happened. But great
talking. His daughter actually wrote me to say hi. She was now in
highschool or something like that. Or maybe even college? :)

Dave Small and Codeheads... the two reasons I keep an ST around to this
day.

When you reboot the machine, its probably booting the boot sector from the hard drive first rather than the floppy's auto program (I cant be sure with the mega, never had one). If so, then its loading hddriver 7 off the HD bootsector, then loading the auto folder version of hddriver 8.
Try holding down the CTRL key to force the computer to skip booting *ANY* devices, then once you get to GEM, insert HDDRIVER V8 floppy, browse to auto folder and run hddriver.prg. Next run hddrutil.app and do an install driver or what ever it is, I cant remember, then reboot mega without the floppy.

If this doesnt work, im sure Uwe will be able to help you further.

BTW. A little tip:
Whenever upgrading one version to another *NEVER* delete anything. In this case you should have renamed the folder to HDDRIVER.7 or something.

Coda.

Not as far as I can tell. Google '"dave small" atari'. The second link
was "Where are they now?" The server for that link was down;
archive.org says it was last updated in April 2004.

That page
<http://web.archive.org/web/20040405210412/http://www.toyz.org/mrblog/archives/00000115.html>

points to an AtariAge forum thread from 2001.
<http://www.atariage.com/forums/viewtopic.php?t=9183&highlight=spectre+gcr>

Found an AOL page with a photo, but I have no idea how recent that is.
<http://hometown.aol.com/davetracer/index.html>

The AOL page doesn't mention Atari at all, but it came from his AtariAge
user profile.

Well, I didn't simply delete it, I used "install" to overwrite the old
version. Which I guess, amounts to the same thing <grin>.

Anyways, its fixed now. See my reply to coda for full details but it was
along the lines of what you were both saying, AFAICT.

Thanks ever so much! :-)

It was <alt>, no software at all, then ran hddriver.prg from the auto
folder on the floppy. It found the partitions correctly then. Then running
the utility app from the floppy, auto configure, with preserve old
partitions on, and bingo, the reboot worked fine.

> If this doesnt work, im sure Uwe will be able to help you further.

I've no doubt that the "guru" of Atari hard drives could! <smile>

One thing I've noticed though, there seems to be one small bootup diff.
from 7 to 8.15. On bootup from the hard drive, there is a 3-4 second
pause, right after the devices are displayed. Its not the floppy pause,
I've got a blank, formatted floppy in the drive. This pause was not there
under 7.0. Its probably just some odd setting or the other, I'll review
the options when I get more time later.

> BTW. A little tip:
> Whenever upgrading one version to another *NEVER* delete anything. In
> this case you should have renamed the folder to HDDRIVER.7 or
> something.

Actually, while thats good advice, its not the best (wait, wait, don't get
upset!), the best advice would be for gung-ho people like me to *ASK* here
on comp.sys.atari.st FIRST so that people like you, Uwe, and Lonny can
keep me out of trouble! <big grin>

Thanks ever so much (and to the forums on Atari-age that also posted
helpful info)!!!

Do what? It flashes!! Tell me more, can't have that. Does it really?
It's working yes? Priv-mail me, bit startled by that..

Erm, only thing I can imagine is that the PS2_IS_MOUSE_CONNECTED proc is
playing up and repeatedly re-initialising it. Not entirely refined that
proc, had problems developing that one, relies on the CLOCK and DATA
going low, sometimes read as highs due to the port latching over.

Tell me more...

Aly

Are you sure about the bronze??? I thought pennies were copper until
the zinc centers were put in about 1982...that is, except the 1943 steel
pennies made during WWII. I *never* heard of bronze pennies.

Whatever it was that caused your problem, please note that there should
not be any delay when booting. My guess is that you have configured SCSI
IDs or LUNs without any devices present. You should only enable those
IDs that correspond to an existing device. You can use "Auto
Configuring" for that, but you can also do it manually.

Sure, and I do the same (and have done), but there is just this
crossover, I feel. If you want to do something with a computer that
no-one else really wants to do because the technology simply isn't
suitable for modern requirements, paying more for the hardware makes no
sense at all. It's just obsolete hardware. I've got a house full of it,
I enjoy using it, but I can still see this.

>>I moved from Falcon to Mac for music, because whilst there is a certain
>>cachet to using the Falcon, only the most determined retrophile would

>>manufacturer!) and good quality Audio I/O.
>
>
> From your viewpoint, I understand what you are saying. If I were a music
> professional, I would absolutely agree with you.

Even not as a music professional - I enjoyed using the Falcon, but I
wanted the better MIDI capability, and the recording. Even though the
Falcon had been out of production for years, and Falcons were in fact at
their cheapest, the additional hardware was still priced at insane
levels for something unsupported and limited.

I'd have liked to keep using the Falcon, but it lacked the stability of
the ST for crude MIDI stuff, and the cost/benefit of the advanced
stuff... madness.

But, if I found a cheap Falcon with all the audio bits, I'd be using it
right now, and telling people "Hey! I made this on 12 year old obsolete
technology! Isn't that amazing!".

You think Falcons are retro? I do stuff with Apple IIs - my IIgs runs
VNC, is a webserver, an IRC client.. and I'm waiting for the same
abilities to come to the Apple //e via Contiki.

> 03:00: SyQuest EZ135s 1.17 Direct Access

If your boot drive is not device 0 but device 1 your problem most likely resulted from HDDRIVER (the one you installed on your hard disk, not the one from the floppy) not being configured to check your boot device. The default installation only checks device 0, but not 1. This means that after installing you can boot the hard disk driver (TOS does that for you) but the driver, when started by TOS, does not find the boot partition. The result is just like you described: No partitions are found and the Atari is in a state as if no hard disk were connected: Only A: and B: icons, low resolution etc.

In general I recommend using device 0 as the boot device in order to avoid problems like that. Other configurations work as well, but they need more care when configuring. The "Auto Configuring" option of hDDRUTIL is helpful in this case because it automatically finds all connected devices and adds them to HDDRIVER's device list.

Thats a tought one, depending on priorities. If you def. want to do DTP, and its the most important, the the TT with its 19" monitor and high-res is hard to beat. But...the TT is the least compatible with games. Thats not to say that there are no games for it. If you wanted to play games as the top priority, but still wanted to do some DTP, then the Mega STe has the most power with the most compatibilty. The Falcon always is a contender, IMO, for just about anything. Its more compatible than the TT, though not as compatible as the STe's, but offers greater res/colors than the STe's, although not (stock) higher than the TTs special high-rez mode. The Falcon is enjoying better support, IMO. I see many more wonderful hardware announcements concerning it than the other models. Examples, CT60/63/PCI, EtherNAT, SuperVidel, etc, etc,..

Availability is another issue - it is getting harder to find higher end Atari's these days.

If Rodolphe Czuba manages to make the Hawk a reality, it might be another choice to consider as well.

Just my 2 cents worth. Others, I'm sure, will weigh in with helpful and thoughtful insights...

Well, I was watching it this morning, and it seems to be when its trying
to access the EZ135 during bootup. I don't normally keep a cart actually
in it. The pause starts, disk access light on the EZ is blinking (and
remember this is no great amount of time, maybe 3-4 secs.) then the
disk access light stops and the boot process continues on just fine.

This sounds as if the EZ takes unusually long to report that there is no
cartridge in the drive. I doubt there is anything you can do about it
(except booting with a cartridge inserted) because HDDRIVER has to wait
for the EZ to respond before proceeding.

That sounds right. The reason I left the cart out though, is that it takes even longer when it reads the cart. I'm thinking that particular cart is probably getting old/wore out.

Also, under v7.0, it did not have this wait. I 'm thinking its probably some setting or the other that I've got different.

Its not a problem either way - since its the Mega ST system that runs my BBS it only gets rebooted/shutdown-powered up about once a month, or longer (if necessary) anyways.

Legendary rock-solid Atari systems - gotta love it. <grin>

There's plenty of CrazyDots cards for sale on ebay UK or DE or some of the other ones. I remember I saw some sold 3 separate times consecutively. Most auctions say they will only ship in the local country but if you email, a lot of times they'll ship to the US. Might be a nice step up from the AlberTT.

Thanks,
Mark

Are you talking about this Atari port on Aranym, or the Windows port? I have the Mac version running on a basic 350MHz G3 iMac, and all games seem to run at 100% full speed with no signs of slowdown at all. Then again, I do tend to stick to the older classics, which I prefer.

Now, when I have the time for the download, and to *try* to get Mint running again, I'll be trying out the new Atari port on my CT60. I know it would probably be a bear of a program to port in this way, but I do hope it can be ported to run on a more basic Atari system instead of Unix/Mint, so that it can be run from TOS or Magic someday. Even with EasyMint, I've had such a horrible time getting things to operate correctly, I'm always forced to return to Magic and TOS, so porting for general Atari systems rather than Mint-only would be nice, when possible.

US cents (pennies is an informal term) were 95% copper and 5% zinc from 1864 until 1982. This is not bronze (an alloy of copper and tin). It might be considered brass (an alloy of copper and zinc) except that brass is generally far more than 5% zinc.

We now return you to our discussion of Atari computers.

In fact, the only problem preventing it from running under TOS is the
default path setup. It looks for config files/roms in
/usr/local/share/xmame and in ${HOME}/.xmame. I just have to search where
these paths are setup, and add '.' (current directory) to the list of
search paths.

As I said, this is a straight recompilation, to see where problems may
come from (like this path problem).

What happens when you try to read the cd? Does the computer flash some kind of message? How have you gotten things setup with the programs? When I have problems with CDBackup and CDISO, it usually has to do with termination of the last device on my SCSI line. I just went through that.

You are correct about reading a CDBackup disc only on an Atari, but also the drive doing the reading should be a CDRW drive and not just a CDR drive. Discs from a CDISO backup should be able to be read by any computer.

Okay, I've got a Mega ST4, Plextor SCSI CDR, 1-2x burning speeds, using HDDriver 8.15 and the latest Anodyne Software (CDBackup, CDiso, ExtenDOS Gold Pro).

I've made 1 successful burn so far of my C partition, and about 15 coasters. It was with Sony media. I'm still using Sony media.

The Plextor drive does correctly read all commercial CDs and CDs that I've burnt under Linux just fine, no problems at all.

The one successful burn was using CDBackup, entire partition. This means I can read it on my Atari comps, but no where else.

When I use CDBackup (entire partition or used space) or CDIso, the software completes, reports success, ejects the CDR, but I can not read the CD on my Atari, or in the case of CDIso, on my Linux boxes.

The burn light does come on during the burn process. I used 1x since this is a lower end Atari.

I bought a Philip CD cleaner and used it but it has apparently made no difference.

I've got a 2nd Yamaha SCSI CDRW burner in my Falcon case, I can pull it and will next, but before I do that, can anyone offer any advice, hints, tips or tricks?

I really don't think its the software, as I've used it just fine on my Falcon. I'm leaning towards a bad burner. What does everyone think?

Thanks gang.

Have you contacted Anodyne? I'm asking this because usually when I see questions about my own software in newsgroups it's the only place where this question was asked, instead of (maybe additionally) writing me an email. Not everybody is reading newsgroups, and here (like in other newsgroups) the answer are not always right.

Hi Patrice,

I downloaded and installed Xmame a few days ago and then found a game to
download called KasumiNinja (no idea what it is).

Running Xmame chucked out the report below but the game didn't start.
I must have something wrong.

I placed the zip file in a folder /usr/local/share/xmame/roms

Peter

I've found that modern CD-R discs often perform poorly at slow burning speeds. I started running into problems with a 2x Sony CD-R drive about four years ago, even though it had performed flawlessly before then. The change was quite sudden and coincided EXACTLY with the purchase of some new discs. Some brands performed better than others after that point, but the general compatibility was way down. Thus, I'd suggest you buy small quantities of new discs of any given brand or type until you've tested them thoroughly. If you can buy some old stock of older discs (maybe check eBay), you might have better luck.

Of course, this is all VERY speculative. It's entirely possible that you're running into some other problem. At the very least, though, it's worth buying a few discs of other brands as test discs.

You raise a good point there. The local stores (Wal-mart) etc, do sell 5
packs from different manufacturers, so I guess I'll mix 'n match and see
if that makes a difference.

Thanks!

Well, I was gonna get input from here first, but the point you raise makes sense. I'll try some of the suggestions I've received here so far, and if nothing works, contact Roger.

Thanks!

I've only got the Plextor for use with my Mega ST and it is a 2x CDR,
unfortunately. :-(

Ron,

I agree that it could be the brand of CDs you are using.

I have used Sony CDs on my Teac 55s CDR at 1x-4x speeds and
usually end up with more bad CDs than good ones.

Since I changed brands, I have noticed much better results.

Funny, even on the Atari 8-bit I remember the Sony brand of 5 1/4 disks
always gave me problems and avoided them. Have heard similar stories
from other Atari users.

I have had very good performance out of Memorex, Imation, TDK, and
FujiFilm
CDR and CDRW media on the CT2B Falcon with the Teac 55s CDR.
I have used SoundPools CD Recording software, ExtenDos Gold and CD
Writer,
but not the latest version yet as I've not upgraded, but will soon.

I have used SoundPools CD Recording software the most on the CT2B
Falcon, and
with good media and all things setup correctly I normally have at least
a 95%
success rate when burning a CD. And they work fine on the VAIO.
Of course, I use ExtenDos Gold to read the CDs on the Falcons and all my
Ataris.
It's the best IMO. Just haven't tried CD Writer that much. I think the
version I have
only does Audio CDs, Not sure on that. But I know I need to upgrade!

The most common Error I have when burning a CD is Buffer
OverRun/UnderRun on
the CT2B Falcon. But if the CD gets completed it is always good.

After I upgrade to the latest version of CD Writer/ExtenDos Gold. I'll
use it
to burn CDs more and see how it works on the 2 Yamaha's I have. One is
faster than the other. And the Teac as well.

I need to connect at least one of the Yamaha's up to one of my stock
Falcons
and see how things go. And try the Teac on it too, just to see what
difference
there is if any. I've never burned a CD on a Stock Falcon or Atari
unless you
count the normal Falcon mode of the CT2B. I can burn in either Turbo or

normal
Falcon mode. But I do think I may have a program running that causes
problems
when burning a CD. As I have almost 100% success, if I do a Clean Falcon
Boot,
by holding down the control key and running SoundPools software all
alone with
nothing else. No Control Panel, ACCs or anything.

Will take a while to find the program or programs as I run alot of stuff
at once.

You might try disabling any un-needed software that you have running on
the Mega
and see if that helps as well.

I have 3 external CDRW burners on my VAIO, and the Brand of CD Media
does make a
difference on them. The type of Sony CD Media I had was giving me
problems on the
VAIO as well, but after switching to a different brand mentioned above,
no real
problems.

I got it from here http://www.rom-world.com/ which I found by Googling
for
Xmame and roms so I assumed it was the right sort of file, maybe not.

Do you have any useful links to the correct rom files ?

Hi all,

We are now taking pre-orders fo the project now named "PeST".

You can order here http://www.aqtq39.dsl.pipex.com/ps2.htm

the offical page is http://www.cps-electronics.co.uk/web/PS2.htm (will update shortly)

We need to get a number of orders before PCB's will be made at factory. We will count the number of orders towards the end of next month 30/09/05 approx. Orders at that time will be produced.

Alison will be setting up a store on Ebay for those who wish to buy though there. Probably benefit UK orders mostly. Alison will post more detials on that in due course.

Documents and specs will also be posted in a few days.

Chris

Well, I was thinking thats a possibility. Even though I've had no problems at all with these 700mb Sonys and the Plextor in my Linux box.

<snip>

> It's the best IMO. Just haven't tried CD Writer that much. I think the

> only does Audio CDs, Not sure on that. But I know I need to upgrade!

Yes, the latest versions include CDBackup (Atari backup), CDaudio (burns audio CDs) and CDiso (standard iso9660 backups that can be read by all).

I was looking at Anodynes website the other day, and it looks like he's gonna have support for DVDs soon!

> The most common Error I have when burning a CD is Buffer
> OverRun/UnderRun on
> the CT2B Falcon. But if the CD gets completed it is always good.

Hmm, see thats why I was leaning towards a bad burner. CDBackup and CDiso finish completely and both report success when they are done. I'm getting no errors of any kind during burning. However, when I put the burned copy back in, I always get the "Disk in drive P may be damaged, retry or cancel" error.

I have tried reading the disks (the iso9660 ones) in my Linux comps and they give errors there as well.

<snip>

> You might try disabling any un-needed software that you have running on

> and see if that helps as well.

Because I use it to run my BBS, its pretty well stripped down to only what is needed already. I can try further disabling of everything thats left though.

Thanks.

No, sorry I don't. I think I setup Xmame under Linux one time, but never
did fool with it much after that...

If I'm wrong others will correct me, but I'd be surprised if Xmame
supports any Jaguar games. My understanding is that the Jag is hard to
emulate, although there is an emulator that I had running under Linux one
time. I never could get sound to work on it though.

The "Data on Drive P: may be damaged" error is not likely to be buffer
underrun (since the software is known to work on the ST @ 1x speed),
but it's easy enough to check -- try burning a very small CD, say 1 Mb
and see if the same error occurs.

Even if there is buffer underrun, CDISO should give an error message,
so I doubt that's the case.

Well, thats what Edward posted. Here is what I've got:

Mega ST -> ICD Link2/plugged into an Syquest EZ135 -> out to a shoebox
style case with a 4 gig Seagate HD, then internally to the CDR, then the
SCSI cable comes to an external connection on the same case.

Termination:

Mega ST - beginning of chain
Link2/Syquest - not terminated
Seagate HD - not terminated
Plextor CDR - not terminated
External connection on HD case - termination block (end of chain).

That should be correct, AFAICT. HDDriver and Extendos both report all the
devices, each with separate ID numbers. The drives work fine, no data
corruption when copying files, and with a BBS and all the file activity
that goes on, you'd know it pretty darn quick. :-)

The CDR reads all disks just fine, except the ones I burn on it. All
commercial CDs are read fine, as well as any CDs that I've burnt on my
Linux comps.

No thats definitely not it. I just finished a test I was trying. I took out that older Plextor CDR and put my Falcons Plextor 12/4/32 in its place. I can report that I just successfully burnt an iso9660 CD with CDiso and its just fine. Both the Atari and my Linux box reads it just fine. So to sum it up, everything worked with swapping out the drive and burning at 2x, which is the Plextor from the Falcons minimum speed.

So now, I need to try something else. Somebody in another post in this thread mentioned that the newer media sometimes doesn't like 1x. I had not tried that with the older Plextor CDR. Since I've got the newer Plextor hooked up right now, I'm going to go ahead and back up all my data. Then I'll swap the drives back out and see if going to 2x with the older Plextor CDR and the Sony media will work.

If it works, then I guess its the media after all. If it does not work, I'm going to assume that the older Plextor will work with reading CDs but not burning any (does it have different lasers for reading and writing? Maybe just the one that burns is bad?).

I should be able to finish up later tonight and I'll post what results I get.

Thanks everyone.

3484. TeraDesk 3.61 released

Newsgroup: comp.sys.atari.st
Date: 2005-08-18 23:37:13 UTC
From: vdjole@EUnet.yu
Message-ID: <de3637$ts3$1@news.eunet.yu>
Source record: 11761

Version 3.61 of TeraDesk open-source desktop is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

This is a bug-fix update. Soon after the release of V3.60 some errors were noticed, two of them rather serious, and they have now been fixed. Upgrade from V3.60 as soon as possible is advised. Beware that any icons created in V3.60 by dragging objects from directory windows to the desktop may have corrupt or missing object path information.

Have in mind that substantial changes were made in TeraDesk since V3.50; although the program has been tested as much as reasonable, it is possible that some newly created bugs has passed unnoticed. If you observe any anomalies, please let me know.

See the history file and the hypertext manual for more information.

Have fun.

RJH> bad?).

This really could be the point. The first burning lasers were not that durable, so maybe it really has become too weak for producing correct patterns on the CDR-media.

You mentioned that one burning attempt succeeded (with the backup tool) - was that the first CDR that you burned with the old Plextor (and all the unreadable ones produced afterwards)? This would support this assumption.

The Link2 doesn't support arbitration. Most CD-Rs like to see it,
although if that was the problem, I would expect that you wouldn't be
able to read or write to the recorder.

There's some possibility that your device chain might be too long - I
don't know what the limit is for the Link2, but don't assume that it's
necessarily the SCSI max (which is 6 metres). It could also be a bad
cable somewhere in the chain. Or even (unlikely) a bad terminator.

>That should be correct, AFAICT. HDDriver and Extendos both report all the
>devices, each with separate ID numbers.

Are you using HDDRIVER"S SCSIDRV driver, or ExtenDOS's internal
routines?

The drives work fine, no data

If CDISO doesn't report any problems, then the recorder isn't reporting any problems either (unless there's a pretty gross bug in the drivers which no-one else has found). If the recorder isn't reporting problems, I think it must be either a hardware failure (presumably only in the write hardware) or a termination/cable problem.

By the way, although I appreciate people wanting to solve problems without taking up my valuable :-) time, I really don't mind helping out. So please feel free to email me if you (or anyone else) has any problem with any Anodyne Software products. Please use the email address on the web site, I post under a Yahoo account to try to reduce spam (fat chance).

Reading from that CDR is not a problem. Everything I've thrown at it,
besides CDs actually burnt by it, are read just fine.

> There's some possibility that your device chain might be too long - I
> don't know what the limit is for the Link2, but don't assume that it's

All valid possibilites, but I'm fairly sure none of the above is the
problem (see below).

> Are you using HDDRIVER"S SCSIDRV driver, or ExtenDOS's internal
> routines?

I'm going to make an assumption here - I recently upgraded to v8.15 of
HDDriver from 7.0. I used the autoconfigure all devices option, so unless
it sets the SCSIDRV to be used automatically, then I would say no, because
I didn't specifically see or check that option. So I'm using ExtenDOS's
internal routines, I suppose. Perhaps Uwe can let us know for sure about
that.

> If CDISO doesn't report any problems, then the recorder isn't reporting

> Roger Burrows

I understand Roger, and thanks for replying to this thread. Most of the time, I will post/ask questions here, because I figure if it gets resolved then its available for anyone else to read as well. Perhaps it will help someone else who encounters the same problem.

Now. Here is why I don't think its anything but hardware failure on the part of the older Plextor CDR (you might have already read this in another message I posted, so apologies if you have). I took a much newer Plextor CDRW, 12/4/32, out of my Falcon and replaced the older CDR in my Mega ST setup. I made *no* other changes. Using CDIso at 2x (the min speed the newer driver will apparently do), I proceeded to backup 3-4 gigs of data on multiple CDs with -> ZERO <- coasters or errors. So AFAICT, that pretty well seems to point to the older CDR instead of termination, cable length, or CD media problems. Another user did post that he thought some of the newer CD media (I'm using Sony CDRs, if you didn't catch that ealier in the thread) had problems being burnt at 1x speed. I hadn't heard this before. So next I'm going to put the older CDR back in, and try burning at 2x with it. If it still doesn't work, then I believe its the problem. If it does work at 2x, then I guess its the media.

I'll try that out tomorrow and post the results.

Again, thanks for the reply Roger and mega thanks for continuing to support such great software for the Atari community!!!

See ya. :-)

Whether the SCSI driver is used or not depends on a setting in the CD
writer software. The SCSI driver is always available and it depends on
the thirdy-party software whether it is used or not.

> Is my Falcon faulty ? or, do they all behave the same way ?

Before I sold my Falcon earlier this year I had a 1.2GB IDE disk
in it, and this topped out at 2.5MB/sec, but only in lower colour
modes. I once took the 1.2GB out and made a disk image of it to
use with ARAnyM in Mandrake Linux - creating the image took just 2
minutes...an average of 10.5MB/sec. Obviously the IDE controller in
the Falcon will be the limiting factor with all but the slowest and
oldest IDE disk units....

Hello,

I got the same warning when I tried to read a CD Backup disc in a CDR drive.
The Plextor above should get this warning. Any ISO CD should do fine in the
Plextor drive.

3501. Re: Burning CDs (resolved)

Newsgroup: comp.sys.atari.st
Date: 2005-08-19 18:30:55 UTC
From: "Ronald J. Hall" <dark_lord@charter.net>
Message-ID: <pan.2005.08.19.18.30.54.587412@charter.net>
Source record: 11775

Okay, I've now had a chance to swap out drives. I've put the older Plextor CDR back in, and took the newer Plextor CDRW 12/4/32 out, after backing up all my data from the BBS.

I tried burning the Sony media at 2x with the older Plextor and had the same result; CDiso reports a completely successful burn, but I still get the "Data on Drive P may be damaged - Retry or Cancel" error when trying to read the freshly burned CD. Inspecting the Sony CD after burning, it doesn't even look like anything has been burnt to it.

I think we can pretty well conclude that while the CDR is reading any CDs not actually burnt on it just fine, its burn mechanism (laser, etc) is basically shot. Guess I'm in the market for another one, once I get the funds. :-)

I wish to thank Roger, Uwe, Galen, Phantomm Jean-Luc, Edward and anyone else who contributed to this thread. Thanks guys! :-)

Yes, there's a setting under 'Advanced options' in the ExtenDOS
installation/reconfiguration program (INSTALL.APP) to use SCSIDRV or
ExtenDOS internal routines. The default is to use the SCSI driver, if
available for that device (which it will be when you've used the auto
configuring option in HDDRIVER).

Roger

Thanks Roger. I guess you already read my earlier posts, it was bad
hardware on the older Plextor drive.

Still, this brings up another question for me - what difference, if any is
there between using the SCSI driver, and ExtenDOS's internal routines? Any
advantages either way?

Thanks much.

3509. zview6

Newsgroup: comp.sys.atari.st
Date: 2005-08-20 12:21:20 UTC
From: Martin Tarenskeen <nospam@telebyte.nl>
Message-ID: <slrndge820.3tf.nospam@localhost.localdomain>
Source record: 11785

Hi,

I got errors when trying to unpack the zview6.lzh archive from Zorro's website. The problem occurred when using the lha command on both my SpareMiNT system and my Linux Fedora Core 3 system. Anyone else experienced similar problems ?

Then I downloaded the zip archive from the chapelie ftp site and this one unpacked without problems.

ZVIEW6 is working great. I really appreciate the possibility to have a image & PDF viewer on my ARAnyM boxnow that doesn't require NVDI or the GEM XServer. A zoom function would be welcome, but I'm sure that will be added in the near future.

I have a problem though with PDF files with music scores that I created using Mup (Music Publisher) and ps2pdf (Ghostscript). ZVIEW displays the lines and beams correctly, but not the noteheads. I'm having the same problem on my Linux box when using gpdf, no problems when using xpdf or ghostscript for viewing.

Music PDF scores that were created by abcm2ps + ps2pdf are displayed without problems.

abcm2ps and ghostscript (ps2pdf is part of the ghostscript distribution) can be found in the SpareMiNT RPM collection.For mup go to www.arkkra.com or download the SpareMiNT version from http://www.home.zonnet.nl/m.tarenskeen/download/mint

Try Maplin, Rapid Electronics, Farnell and RS. Try Ebay as well.
Sometimes it's actually cheaper to buy a cable, and chop it up than buy
the parts to make one.

> advantages either way?

Always use the SCSI driver if more than one software package (note that
a hard disk driver is such a software pacakges) accesses IDE or SCSI
devices. Otherwise one software packages might change SCSI bus signals
without the other package knowing about it, which can lead to problems.
Additionally (but for the same reason), you cannot use MagiC's
background DMA without ensuring that all SCSI-related software uses the
SCSI driver interface.
The fact that it can be dangerous to let several independent programs
use the SCSI bus as they want to was one of the reasons why Steffen
Engel designed the SCSI driver interface years ago. On other platforms,
like Windows or Linux/Unix, such an interface is the only way to access
peripherals.

CAF users know what it means if a software does not use the SCSI driver
but SCSI code of its own: They cannot use any hard disk driver they want
because the CAF SCSI code results in incompatibilities.

Hiya,

Nope, not suitable for the application here. All of the Maplin, Rapid
etc. offerings are standard industrial D-types which barely fit into an
ST's mouse port. As for buying an existing cable, when mass producing
something I'm not sure the customers would be happy paying an extra £6
for a chopped up 1.5m Atari extension cable when the slimline D-types
are out there. Just don't want to buy 10,000 of them.

The slimline plugs/sockets that you put together yourself are out there,
though manufacturers who use them won't tell you who their suppliers
are.

I need slimline sockets, about 100-200 of them. Years ago Amstrad
bought up a company's entire stock for their joysticks at something
silly like a penny a piece.

Hmmmm??? Have you tried opening up the ST and pushing down all of th chips and
then trying it again? That has solved many problems for me from time to time.

From: Andrew Summers <asummers@columbus.rr.com>
Message-ID: <210820051353145434%asummers@columbus.rr.com>
Source record: 11798

I was loading a game last night and my 1040ST crashed in the middle of loading. When I rebooted it, it would no longer access any disk. It behaves normally on reboot in that it seeks a disk if none is inserted, but if one is inserted it quickly goes to the green desktop exactly as if it had a blank formatted disk inserted. It views every disk as a blank disk.

I have swapped the drive, and it isn't the drive, so it must be on the system board.

Any ideas? worth fixing? I hate to toss it, as it is barely used in mint condition, rubber feet and all, no discoloration etc.

thanks

Andy

Try formatting a disc and writing to it. Something like the
desktop.inf. Swap the WD1772 over, re-insert it.

Personally, I feel that *any* Atari is worth fixing! <grin>

Seriously though, have you tried the time honored tradition of taking all connecting cables loose from the ST, raising it about 6-12 inches and dropping it on a hard surface? If you do that, and it works, its probably chip creep. The chips will "creep" out of their sockets sometimes, due to heat expansion/contraction, etc, etc,..

If it does work, then you'd probably want to disassemble the ST and check all your socketed chips, connections.

If it doesn't work I guess I'd swap out cables to see if one went bad.

Hope something here helps.

PS If you do decide to toss it out, e-mail me for my address! <smile>

Guys, has anyone been able to get through to here lately? I've been trying
for about 2-3 days now and it keeps timing out.

I'm looking for the instructions on how to setup an EtherNEC with STing.

I'm curious to see if I can get it working with my BBS and thusly, a
faster transfer rate than the serial port.

Thanks!

Yikes, 6-12 inches? That could seriously break it. The standard is
actually 4" in the "Atari 4 inch drop" LOL!

Hi all,

My page is http://fujiman.no-ip.com. It is hosted on my home 'puter.

I hope to have a FAQ soon for Magic, MiNT and STing soon. If you have
any configuration questions or problems you can email me at
rorymcmahon@nospamyahoo.com . I will try my best to help you out.

I also have ichat/yahoo messenger user bigmacmang3 and I can try to
walk you through some file configuration.

If you have a FAQ or suggestions for a FAQ, let me know.

Thanks,
Rory

Hi all,

My page is http://fujiman.no-ip.com. It is hosted on my home 'puter.

I hope to have a FAQ soon for Magic, MiNT and STing soon. If you have
any configuration questions or problems you can email me at
rorymcmahon@nospamyahoo.com . I will try my best to help you out.

I also have ichat/yahoo messenger user bigmacmang3 and I can try to
walk you through some file configuration.

If you have a FAQ or suggestions for a FAQ, let me know.

Thanks,
Rory

I forgot to say, start at 2", then when that doesn't fix it, work your way
up to 12", in 4" increments. <big grin>

Glad you got it working, but you do know that means you will sooner or
later need to take it apart and give the socketed chips a good reseating,
right?

I have some questions already. I went to the Atari hardware sight that was
mentioned, where there is a small walkthrough. Keep in mind, I've not
tried *anything* yet.

1. The ip address that is mentioned - is it really locked into just that
one?
2. I don't have *any* Windows machines, never have, never will. I do have
a Dlink hardware router. I'm assuming that I can just assign an ip address
by it, to the same effect, right?

Thanks.

Here is why, you logged on as a "visitor" and never obtained a permanent
user account. I need to update that script file so that if you are a
visitor it ignores you. Visitors can tour the BBS, but honestly are very
limited in what they can do/see. Which is as it should be.

Why not take just a couple of minutes and get a permanent account? :-)

You are talking about an internal drive correct? Yes that is possible. I installed a PC TEAC drive in a 1040ST. After changing the jumpers around, the drive worked perfectly.

Not really. Many items are worth more with the box intact. In some
cases, even double the value.

Cheers,
Mike T.

Same for me. I hadn't booted it up for a while and when I did I got a load of errors. Also I noticed the Mint.Cnf file was messed. I had to copy in my backup in order to try it again. I am going to try and get it back by using the EasyMint installation. I just want to format my hard drive and I will copy over my files that I had backed up onto a CD.

Just how are you backing up Mint onto a CD?

> cases, even double the value.

The box, it's value - it's all perception based. Most collectors of these kinds of items are somewhat obsessive-compulsive. They want to complete a collection, they seek to have something the other collectors do not. The reason anything has value is because someone out there wants it or it would be worthless otherwise. I don't mean that like it's a bad thing, merely that it's a reality.

Besides - that box looked like it was in pretty rough shape.

From a collecting standpoint - MHO is that an item like the B&H box is only worth something if it matched up to the computer that came with it (BH with original packing container), or if it had some historical or special value. Maybe... "B&H Apple II box, originally hand-packaged by Woz himself - has small blood stain from where Woz accidentally nicked himself with the packing tape dispenser. Proof of DNA on file, will provide Certificate of Authenticity. Clone your own personal Woz."

Ick!

3550. Toasting MiNT

Newsgroup: comp.sys.atari.st
Date: 2005-08-22 20:12:25 UTC
From: Jim DeClercq <jimd@panix1.panix.com>
Message-ID: <dedbj9$g95$1@reader2.panix.com>
Source record: 11725

My MiNT installation has gone belly up enough times for me to have learned how to refill it quickly, but the last two times it died, I checked something I had never checked before. My boot drive had some lost sectors. Used Discus, could use ICD Cleanup or Diamond Edge or some other programs to find and fix this. The interesting thing was that the lost sectors had the same content, log files from two programs, and two chunks of binary.

It may be possible for a damaged boot drive to munge the MiNT drive. If enough of the crowd of MiNT users who have to back up and start over will be so kind as to investigate their boot drive when MiNT gets damaged, someone may get to the bottom of this yet.

BTW, CD backups work fine. Writing at 4X speed on my TT can be done only by disabling the MiNT.CNF file and booting into single tasking MiNT. Otherwise, I will get a disk error at exactly the point, and make a batch of coasters.

3551. Wanted to rent--Hypercopy registered

Newsgroup: comp.sys.atari.st
Date: 2005-08-22 20:20:01 UTC
From: Jim DeClercq <jimd@panix1.panix.com>
Message-ID: <dedc1h$g95$2@reader2.panix.com>
Source record: 11726

I have dispatched more than enough funds, in Euros, to the last known address of the author of Hypercopy v.1.7, long enough to expect a registration code any day now.

I want to investigate something while nature takes its course.

Hcopy will let you investigate anything on the boot sector of a disk. The registered version will let you save a boot sector format to use in formatting more disks.

The drive on a Dell clone at work fills the boot sector with unimportant, I think, details, and the details my Atari TT and unregistered Hypercopy put there are different. I think that copying the Dell boot sector would let me format disks on my TT that will read on the Dell DOS clone.

Thus, I would like to borrow or rent a registered version of Hcopy, for some investigation that might help with several people's problems, and get the author a few more registrations.

Jim

When formatting a floppy disk with DISKUS the Dell did not accept it?
Whether a PC is manufactured by Dell or another vendor should not make
any difference, because DOS basically is DOS, regardless of the vendor.
(DR DOS or MS DOS should not matter here), and DOS is responsible for
evaluating the data on the boot sector.
If your PC does not accept floppy disks created by the TT it might be
because of floppy disk controller incompatibilities, not because of the
actual boot sector content. The Atari controller might produce something
the Dell controller cannot read.
If this is the case it is more than unlikely that any software can fix this.

Most PC drives will do in a pinch, just have to make sure it is set to
ID0. Teac have a solder link on their drives IIRC, and work quite well.

Mark

3555. Cartridge port

Guys for the record, where is pin 1 on the cartridge port? I mean, looking at a Falcon or Mega ST (the cartridge port is standard across the ST/TT/ and Falcon machines, right?), is pin one close to the front, or the backplane?

Thanks.

3558. For Sale: Spectre GCR Cart

Newsgroup: comp.sys.atari.st
Date: 2005-08-23 05:36:32 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <0AyOe.6776$ZD4.4254@bignews3.bellsouth.net>
Source record: 11735

For Sale....

Spectre GCR Cartridge with 128K Mac Roms installed.

Includes Original Manual and a NewsLetter or 2.

Version 3 of the GCR Software. System 6.8.0 on Disk

Also, includes around 100 related Disks of Mac Software.

Cartridge is in very Good Condition. Worked fine last time I

used it on a 1040STE. Fairly Rare Item.

NOT FOR SELL IN THE UK OR GERMANY!

I may trade it to some other Atari Item I don't have.

For asking price, contact me in E-Mail.

Cartridge and etc is in the USA.

: Just how are you backing up Mint onto a CD?

: --
: Edward S. Baiz Jr.
: (Gamer)

It takes two CDs. Usr share is one CD, everything else fits on the other. Extendos, CDISO, set for Unix and MiNT compatibility. The "name changes" work themselves out in the end, from an unadvertized file that puts them back. Nothing much to it other than not trying to record too fast, which will cause a write error at the same point on every disk.

File selector for this is Boxkite. The n_aes file selector does not seem to cooperate at selecting what to back up.

Is that an answer?

Jim

3562. Re: Wanted to rent--Hypercopy registered

Source record: 11739

Thank you. I had forgotten that Discus formats disks, as silly
as that may sound. I will try one and report back.

You may be right, but it may also be true that whatever drives
the floppy drive may look for exact correspondence to its own
boot sector, to avoid some programming lines, and what my Atari
TT writes differs just a little in things other than tracks and
sectors. This is what I want to find out.

Jim

Uwe Seimet <Uwe.Seimet@seimet.de> writes:

3563. Mega STE High Density Drives

Newsgroup: comp.sys.atari.st
Date: 2005-08-23 12:39:55 UTC
From: techie_alison <techie_alison2000@yahoo.com>
Message-ID: <def5er$73b$1@nwrdmz03.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 11740

Hi,

Question is, how straightforward is it if a 720k is already fitted internally?

I'd like to connect an external FDD to my MSTE running TOS 2.06. Most of my externals (5 of em) have been fitted with Sony MPF-520's, which are high density drives.

If I connect one internally then no problems, 1.44!! If external though, then grumble grumble goes the drive.

Have read up on the situation with regular ST/STE's and extra sensing lines. Can only wonder that the sensing line isn't present on an MSTE's floppy port, but then that would mean that an MSTE could only ever use an external 720k drive.

Having read a bit about the reviews on the MSTE, it says it has no way of distinguishing between a 720 and 1440.

Is written here on the bottom of page 2;
http://www.retro.dial.pipex.com/megaste/

Any ideas?

Thanks,

techie_a

1.44 MB floppy works fine on MSTE !
You have to :
- use TOS 2.06, not 2.05 that is buggy for HD...
- put Jumper #6 on ON (the HD button will appear in the FORMAT menu of the TOS !).
- check and correct the GAL UA02 if it is the version #1 (you need #2). And add a wire on the mb if it is the fist model of mb !

Ideas, not necessarily correct: for 720K, you feed a drive with
a 8khz clock, and to get 1440 you feed it with a 16khz clock.

They also need different step rate times. Perhaps you need an auto
folder program that sets the step rate for Drive B. I have one,
if that turns out to be the problem. At least I think I have one,
but have not used it for quite a while. It came with an IB 5 1/2
inch drive.

Growling drive to me suggests a step rate problem. You need to set
the right one somehow.

End ideas.

Jim

Didn't know that this was a problem. I have been running MiNT on My
Falcon/Afterburner, TT and Milan060 for years now and have only had a
fatal disk crash once.

However, PureC 1.1 seems to f**k up sourcefiles when they've been
saved/overwritten several (*many*) times. Only the first sector is
correct, the rest is garbage. I've spent some hours with disk editors
recovering sources... Haven't used PureC under MagiC or TOS enough to say
if this problem is MiNT-related.

Do you happen to use MagiC with boot-logging enabled?? This messed up my
TT really good once, it overwrote mint.prg and much of the contents in
c:/mint/ with log messages.

Sounds like a bug in the memory management of either PureC or MiNT.
I have been using PureC with MagiC for years, without anything like this
ever happening.

I have used Pure C since it came out (1992?) exclusively with
TOS 3.06 almost every day. All those years I never had to recover a
single file that wasnt wasted by myself.

Hello :-)

<smiles> thankkyy you :-)

Ah, have got me worried now... About mb versions etc. etc. and wire
links. The difficult bit would be the GAL UA02 (I think...), assuming
it's a chip to be blown.

Will reply back to this again tomorrow with a complete photo of the
actual MSTE motherboard. It did originally have German TOS 2.05 in
it...

thx,

Aly

3576. Iconnect + Highwire 0.2.5

Newsgroup: comp.sys.atari.st
Date: 2005-08-23 20:45:44 UTC
From: neil@adel6.freeserve.co.uk
Message-ID: <deg1to$6db$1@newsg3.svr.pol.co.uk>
Source record: 11653

Newsgroups: comp.sys.atari.st
From: neil@adel6.freeserve.co.uk (Neil Chester)
Organization:
Subject: Iconnect + Highwire 0.2.5
X-Newsreader: NEWSie Version 0.96 (Atari)

Hi All

Unfortunately had to delete my Newsie folders for the info on how to get Iconnect working with Highwire. But noted down the following fix.

Somebody recommended changing the MTU setting to 1492 in IConf.

With this change, I find that clicking on my home page links brings up messages like "no route to host" or "HTTP 1.1 Gateway Error" eg I don't get to the pages.

The MTU was set at 576 - this produced the same Gateway Error message.

Somebody also recommended setting the RTC to 1492, but I can't find anything called this in the "Profi" mode on IConf!?

Any more thoughts on the matter will be appreciated!

Regards

Neil :-)

It happened to me many times (MagiC! 6.20) before I decided to move the
log to another partition. I think (don't remember) it was due to the
boot selector I was using at the moment (X-Boot, not to mention it).
No problem anymore since I've been using Menu_6 - not to say I kept the
log file on the alternate partition however ;-)

#7 I think Rudolph, but it only affects the Format menu. You can also
use HD cookie, which does the same thing.

> - check and correct the GAL UA02 if it is the version #1 (you need #2). And
> add a wire on the mb if it is the fist model of mb !

The TT and MegaSTE work fine with external HD disk drives, I have built
a couple and never had an issue. It could be a steprate issue, but it
sounds odd. I have even used an old SF314's fitted with a HD drive, and
it worked OK. Could be down to the external drives wiring. Are you just
using the one drive?

Yes and the file is on my web site www.czuba-tech.com
OR you can buy the chip at BEST !

> Will reply back to this again tomorrow with a complete photo of the

So you have to erase the chips with UV and program them with 2.06

Or you can BUY too at BEST.

You need nothing about the step rate !!
No software in the auto folder...

The only problem may be the WD1772 that will not support the 16 MHz
operation instead of 8 MHz.

Sure, the best is to use a AJAX chip (the Atari 16 MHz version of the old
WD1772).
You can buy AJAX at BEST too.
It is expensive.

PS : the MSTE may have a AJAX, check that.
PS2 : it is rare on MSTE, but not rare on first TT030 even if they where not
able to use 1.44 because of the TOS 3.01 no able to manage that.

Unless you really need to look at the boot log it's best to direct its
output to nul instead.

Having said that I've never had a moment's worry with the log.

As a general idea for the next time, might be worth pasting problem
URLs into a Google search box and choosing to view its cached version
of the pages.

Also worth using the Wayback Machine to look at its historical record
of cached pages.

You know the saying, the user knows to kick it to make it work - the engineer knows where to kick it to make it work, and the designer knows why it works when you kick it :-)

> Glad you got it working, but you do know that means you will sooner or
> later need to take it apart and give the socketed chips a good reseating,

That's very true - there aren't many socketed chips, but one that might escape the unwary is under that metal lid in the middle-ish of the motherboard (video shifter).

Hi NG

I have found a pleothora of original classic Atari ST Games, that some of you may be interested in:

The whole lot can be yourï¿½s for the symbolic price of 10 usd/eur (excluding shipping) or some kind of Atari music soft- or hardware depending on what you prefer!.
(If you do not like the games, you have a faboulous chance of upgrading your 720 kb disk deposit!).

I only sell the whole lot!

The Games are in Denmark, Europe.

All games come boxed with full documentation and memorabilia! Most of them have never been used.

See picture here: www.msystem.dk/images/AtariGames.jpg

Sincerely
Peter Hjorth Feddersen

Gamelist:

The Ancient Art of War in the Skies: The World War 1 Strategy & Action Game by MicroProse Simulation Software (1992)

SDI: Now the odds are even by SEGA/AcTiVision

MicroLeague Wrestling by MicroProse Simulation Software (1987)

Their Finest Hour: The battle of Brittain by Lawrence Holland - An historically accurate, action-packed air combat simulation by Lucasfilm Games (1989)

Skyfox by Ray Tobey/Electronic Arts/Ariolasoft (1984)
Skyfox II - The Cygnus Conflict by Dynamix/Electronic Arts (1987)
Terminator 2 - Judgment Day by Ocean (1991)
Corporation by Core Design Limited (1990)
The light corridor by Infogames (1990)
Pinball Dreams by Digital Illusions/21st Century Entertainment Ltd. (1991)
Cruise for a Corpse by Delphine Software (1991)
StarBlade by Simarilis (1990)
Cybercon III by U.S. Gold (1991)
Infestation by Psygnosis (1989)
Crime Does not Pay by Titus Software (1990)

Carrier Command by Rainbird Strategy Simulation (1988)

520 STe Turbo Pack :
Games Disk 1: Indiana Jones & the last crusade by Lucasfilm Ltd.
(1989)
Games Disk 2: Dragons Breath by Palace Software (1990)
Games Disk 3: Blood Money by Psygnosis (1989)
Games Disk 4: Anarchy by Psygnosis (1990)
Games Disk 5: Outrun and Super Cycle by SEGA (1986)
Games Disk 6: Impossible Mission II by Epyx Inc. (1988) and Human
Killing Machine by U.S. Gold Limited (1989)

-and additional titles which i cannot recall!

Sincerely
Peter Hjorth Feddersen, DK

Not sure, but I do not think so. I do use Magic as an OS, but I do not use it
at all when I boot up Magic. The Mint.CNF file does get messed until I try and
boot up MintNet.

Where is the log file usually located and what is the name of the file. Maybe
it did screw me up. Does this mean I need to overwrite my exiting Mint.prg
with a fresh new file? Sounds like it.

Source record: 11667

Hello,

With the (maybe soon) upcoming CTPCI expansion board for CT60, I think it is necessary for future buyers to know which PCI cards they could use, provided a driver exists.

So, if you have an Hades, or a Milan, or an Eclipse on your Falcon, I would like you to send me all the info you got about the PCI card you use (i.e. configuration bytes, product name, url of Atari driver).

You can use this program to read the PCI configuration bytes of your cards (you can send me a screenshot for each card):
http://perso.wanadoo.fr/daroou/productions.htm#PCI_INFO

I will make a page on my website with all the infos collected.

Hi there,

I tried v0.45 yesterday, and it worked fine. No crashes!

However... What happened? The older versions where so much faster..
Ironically, DougQuake has 2-3 times higher FPS than pmdoom 0.45!
Even with sound off, I find it close to unplayable on a 100Mhz 060
(25Mhz bus)..

Please don't let this put you off; I really like your stuff and want to
se more of it!

regards

Pure C does tricky things with out of range filehandles for
its file caching.

I remember vaguely that emutos and/or aranym suffered problems
with this and patched Pure C.

I'll see if I can find the topic in my NG/ML archives.

Your Caps-lock (or shift) key is broken. Buy a new keyboard first.

Looking for an adapter to allow me to use a
PC style keyboard (any) with an Atari ST/STe/Falcon
(any or all).

I'm trying to use a KVM switch to let me use the
same keyboard with an Atari and a PC. I had an
adapter card previously, but seem to have misplaced
it :-(

Thanks

Ian.

After fixing your capslock key, first take a look at the NVDI website.
When you say "Printer" in the Atari world, sooner or later you will need
NVDI. NVDI supports a lot of (old) printers. Unfortunately NVDI seems to
be a dead project and there is no support for newer printers. If you buy
for example a new HP printer, you have to try one of NVDI drivers for an
older HP model and hope that it works.

And be sure the printer you pick has a parallel port. USB-only printers
can't be used on Atari.

Most printer manufacturers still use the same protocols that they
developed a long time ago, with few changes, so there is a good chance
that they will work. The only problem is finding brand new printers
that have parallel ports now.

>And be sure the printer you pick has a parallel port. USB-only printers can't be used on Atari.

Yet. USB will be available for MegaSTE, TT, Falcon, Hades/Milan and
CT60 soon.

> Service Manual, I paid $50.00. So where is the free for the purchaser?
> Just a thought.

Well, its all about atari computers support, theres no more atari computers
on market, the dealers shops are no more interested in these things, so its
all about that we are a really SURVIVORS and it could be much more
progressive to have a free access to some information gates.

Anyway by now I scanning FALCON SERVICE/DEVELOPER MANUAL so should I sell it
for money?

Ok, if somebody want FALCON SERVICE MANUAL I can send PDF or print it,
please tell me if you want one and what price you will pay.

I also got TT schematics so if anybody interested... Feel free to let me
know you want buy it :)

Long Live Atari! Thatï¿½smean new hardware, software and more users!

One small correction. My setup uses three CDs, and one is for all
the rest of the usr files.

Have I put them back? Yes, three times, one drive failure and
two mysterious events. For this, I would suggest the very
latest version of Teradesk, which may be working for this
purpose perfectly by now. It takes very big chunks of data
to copy, and will run unattended. This takes a while.

Prior versions of Teradesk either missed the permission bits,
or the program flag, so I wound up using something else for
the four binary folders. I have not tried the latest, but
the history file is encouraging. Anyway, make sure your
binaries are executable, and your wtmp files are writeable.

One of the two differences between old and new printers is that the
things are stuck in graphics mode, and do not have a text or draft
mode any more. If all you are doing is printing bitmaps, they
work fine, if you can connect it to an Atari.

If you need text mode for anything, you need a used printer, and
a fairly old one, too. I think Epson stopped supporting text with
the Stylus 600.

Ok, but address :)

3613. Compact Flash IDE adapter

Newsgroup: comp.sys.atari.st
Date: 2005-08-25 21:00:39 UTC
From: Jo Even Skarstein <joska@nvg.ntnu.no>
Message-ID: <delbhnihp1@orkan.itea.ntnu.no>
Source record: 11690

I've bought an IDE Compact Flash adapter for my Milan, but I can't get it to recognise any of my CF cards. I've tried to install the adapter both as slave and master, but no difference. My oldest CF card (an old 64Mb TwinMos card) isn't recognised by HD-Driver at all, while my newest card (also from TwinMos, but with 512Mb) is recognised but can't be used.

With the 512Mb card both TOS and HD-Driver recognise it at boot-up, but it's not accessable from the desktop. Hddrutil won't let me format or partition it, it's like the card isn't there at all. If I let hddrutil scan for devices, it reports the card as a Samsung CF-card during the first scan, but any further scans reports it as a Megafile 20...

Both the adapter and both cards works fine on a PC running XP, so I assume that the problem is that HD-Driver is picky about cards. I have HD-Driver 8.03, does anybody know if a more recent version will help? Also, does anybody use CF-cards and IDE-adapters successfully?

My quite new HP Deskjet 3820 can print plain ASCII text just fine. It replaced my Deskjet 500 that died after 10 years of heavy use. But I must say the Deskjet 500 worked more reliable together with my Atari computers than the new 3820. The 3820 frequently goes crazy in the middle of printing a page, and then starts spitting out pages with garbage. Even after a power reset things are not always back to normal :-(

An update to HDDRIVER 8.1 might solve your problem. You should try the
demo version of HDDRIVER 8.1
(http://www.seimet.de/hddriver_english.html). There were several changes
related to CF adapters in the latest versions.

The latest version is 8.16. For registered users updates from 8.1x are free (please email me and provide your serial number), but I would appreciate if I get only emails from those that actually have a need for the latest changes ;-). This is the list of changes since 8.13:

- Added the SYNCHRONIZE CACHE command to the SCSI-3 emulation for IDE drives. (8.14)
- Fixed bug relevant when accessing byte-swapped drives. (8.15)
- The partition information can be saved to the clipboard. (8.15)
- Improved support for IDE CompactFlash adapters. (8.16)

Finally go around to rebooting my Mega ST...do that about once every
couple of months whether it needs it or not (Windoze users quit drooling!)
and yep, sure enough it said, "8.15"... :-)

Hi,

I've just get a Mega Ste, unfortunately, it seems to be dead, because of
our great postal services.......

http://perso.wanadoo.fr/jerome.vernet/specs/atari.htm

It was working before sending...

After little work (!) to make it more presentable, it won't boot...

When power on, fan and hard drive spin, but no front LED, nothing on the
monitor (just a little 'crack' from the SM124 speaker).

I've checked internal connexion, seems to be ok.

Any idea, help ?

Looks like two different possibilities. 1 being one rail of the power supply is damaged but not the other. Like the 5V rail but the 12V rail is okay. Additionally, the power supplies in these things have 4 metal legs. They sit in these grooves. If proper screws aren't in and even if they are, the legs can pop out of these grooves. Since the psu section of your case is... well.. smashed, it's completely reasonable to assume that the leg popped out and is shorting all kinds of stuff. You should not have powered this machine on without a detailed inspection. It could be too late now. Though if you were going for insurance money, your course of action was probably best.

Thanks,
Mark

Yes, that right, some legs (the left one) pop out - no screw at all....
But doesn't seems to make shorting. I didn't put a screw, as it's for
groun dpurpose and the two others are in place. I will check that.

The main board is powered by +5V, I suppose. I will check the power
unit, I've just found the pinout on the net.

Thanks.

3631. EtherNEC help

Newsgroup: comp.sys.atari.st
Date: 2005-08-26 16:08:25 UTC
From: "Ronald J. Hall" <dark_lord@charter.net>
Message-ID: <pan.2005.08.26.16.08.24.446294@charter.net>
Source record: 11608

Okay, I've got the EtherNEC installed. I installed version 1.26 of STing.
I have the following files setup in on my C drive:

AUTO - STING.PRG and STING.INF
CPX - STINGPORT.CPX and STING.CPX
STING - ENEC.MIF and ENEC.STX

I went into the STINGPORT CPX and followed the instructions from these 2
places:

http://www.dwade.freeserve.co.uk/atari/main.html
http://hardware.atari.org/sfl/index.htm

My ROUTE.TAB file looks like this:

```
#
# This is the routing table, to be used by the router to route IP datagrams
#
# Format of routes comprises four entries, separated by TABs :
# - First the network (subnet number) which can be reached by using this
# route.
# - Next the subnet mask associated with that network.
# - Then the port name follows. This is the name as listed by ConfSTinG or
# STNGPORT.CPX.
# - Last entry is the IP address of a host on the attached network that
# can act as a gateway.
#
# The network specified can be directly attached to the specified port, in
# that case no gateway is needed, as the datagram can be routed directly.
# For a route to a network that is directly attached therefore the gateway
# entry should be set to 0.0.0.0.
#
# For an attached Ethernet the gateway entry specifies the gateway out of
# the Ethernet, for a serial line it is simply the host at the other end.
#
# It is advisable to finish the table by a default route. This route is most
# easily obtained by specifying a network 0.0.0.0 with a netmask 0.0.0.0.
#
# Routes with invalid addresses or absent ports are ignored.
#
# 192.68.0.0 255.255.255.240 Modem 1 192.68.0.1
# 130.75.75.0 255.255.255.128 Ser.2/LAN 0.0.0.0
# 0.0.0.0 0.0.0.0 Ser.2/LAN 130.75.75.16
#
192.168.0.104 255.255.255.0 EtherNet 0.0.0.0
0.0.0.0 0.0.0.0 EtherNet 192.168.0.1
```

My DEFAULT.CFG file looks like this:

```
#-------------------------------------------------------------------------
# File name: DEFAULT.CFG (for STinG) Revision date: 2000.07.05
#-------------------------------------------------------------------------
#
# First we have settings used by STinG and its distributed CPX and STX :
# ======================================================================
# (Read STING.HYP for info on how to use them to improve performance.)
#
# Used by the STinG kernel :
#
ALLOCMEM = 100000
#
ACTIVATE = TRUE
THREADING = 10
FRAG_TTL = 60
#
#
# Used for ICMP protocol :
#
ICMP_GMT = -60
ICMP_AD = 10
ICMP_FLAG = 0
#
#
# Used for UDP protocol :
#
UDP_PORT = 1024
UDP_ICMP = 1
#
#
# Used for TCP protocol :
#
TCP_PORT = 1024
MSS = 1460
RCV_WND = 10000
DEF_RTT = 1500
DEF_TTL = 64
TCP_ICMP = 1
#
#
# Used by the DNS resolver :
#
# Note that the first one of these three will not normally be used.
# It will only be used when an address consisting of a single word
# is used in a URI. The DOMAIN value is then appended to complete
# the URI as needed for the nameserver request packets.
# (I still recommend using full URIs instead, to avoid confusion.)
#
DOMAIN = sting.org
```

```
DNS_CACHE = 64
DNS_SAVE = TRUE
#
#
# The three following are not really used by the kernel anymore, as the
# dialer redefines these for each dialup, as they can vary when you have
# more than one ISP dial script. They should be defined here anyway,
# with the values you normally use online, as some offline clients may
# expect to find them, and also for use in local networking.
#
USERNAME = darklord
HOSTNAME = darkforce4.ky.org
FULLNAME = Ronald J. Hall
#
#
# The one following is also redefined by the dialer, and you only need to
# define it here if you use a local network, so all machines in that net
# can find the nameserver (the dialer only defines it on one machine).
# Note that the value of NAMESERVER variables should always be a numeric
# IP address, since another nameserver would be needed to resolve a URI.
# You can specify more than one address, separated by ", " .
# (eg: "NAMESERVER = 193.45.240.2, 193.45.240.4")
#
NAMESERVER = 192.168.0.1
#
#
# Here starts the stuff used by external clients and servers :
# ============================================================
#
# Used by the Dialer :
# --------------------
#
# The setting below is not used by the dialer itself, but by any other
# client in a local network that wishes to contact the dialer which is
# resident on a machine equipped with a modem. (By UDP command packets.)
# If you have no local network, leave it as it is, since that is an IP
# address reserved for the local machine.
#
DIALER = 127.0.0.1
#
#
# The setting below is used by the dialer, but only if you have chosen
# to activate the DIAL.SCR setting to use a dialup batch file. The path
# specified below will then be used to find the batch file.
#
LOGIN_BATCH = C:\DIALER\LOGIN.BAT
#
#
# Used by mailers :
# -----------------
```

```
#
EMAIL = dark_lord@charter.net
SMTP_HOST = smtp.charter.net
MAILER = mymail
#
POP_HOST = pop.charter.net
POP_USERNAME= dark_lord
POP_PASSWORD= tenchi13
#
#
# Used by TIME and DAYTIME clients and servers:
# ------------------------------------------
# (Values used by me, in Sweden in the year 2000.)
#
TIME_ZONE = +60
TIME_SUMMER = 03.26.10.29
TIME_SERVER = time.demon.co.uk
#
#
# Used by MIDI_EMU server (for some netgames) :
# ------------------------------------------
#
MIDI_EMU_OUT = next_IP_in_emulated_Midi_ring
#
#
# Add more here as/when needed by other clients and servers
# that you install in your system. (Read their docs...)
#
#-------------------------------------------------------------------------
# End of file: DEFAULT.CFG
#-------------------------------------------------------------------------
```

I set the values in the STINGPORT.CPX module, saved to C, and rebooted. All comes up with no errors. The MAC address shows up in the CPX. I can use the ping program to ping the localhost at 127.0.0.1, and from the ST I can ping 192.168.0.104. I can't ping out to anything else on the network though, nor can any machine on the network ping -in- to 192.168.0.104.

Keep in mind that this is the LAN address I use for my BBS, so the hardware router 'n stuff is correctly setup for 192.168.0.104. With the Lantronix device in place, I can ping 192.168.0.104 from any other comp on the LAN. All my comps point to the routers default gateway address of 192.168.0.1, so I dunno.

Anyone have any ideas?

Thanks much!

>
> #
> 192.168.0.104 255.255.255.0 EtherNet 0.0.0.0
> 0.0.0.0 0.0.0.0 EtherNet 192.168.0.1

Er... someone correct me if I'm wrong, but it'd rather have to look
like this :

192.168.0.0 255.255.255.0 EtherNet 0.0.0.0
0.0.0.0 0.0.0.0 EtherNet 192.168.0.1

Assumed that your gateway should be 192.168.0.1, else replace by the
value it is set to.

I don't think it should make any difference, because only the first three
bytes should be compared.
However perhaps you should correct. Also have you run the HE-xxx.tos test
programs first to check everything is ok?

Well, I can't speak for the 100MHz and 90MHz CT60's (not lucky enough to afford getting another 68060, once R. Czuba found some). However, I can say that on my 66MHz CT60 with 25MHz bus, PMDOOM 0.45 is also extremely slow. Where the older versions (say around 0.27 or older?) ran incredibly smoothly (I'd say at least 15fps), I get just about 4 or 5 frames per second now. This is both with and without the GEM windowing, and running on both Magic 6, TOS, and the latest Mint version.

I think possibly it is your ROUTE.TAB file. I had problems until I got it straight. You MUST make sure you do not change the spaces between values. Here is your Route.tab:

```
# Routes with invalid addresses or absent ports are ignored.
#
# 192.68.0.0 255.255.255.240 Modem 1 192.68.0.1
# 130.75.75.0 255.255.255.128 Ser.2/LAN 0.0.0.0
# 0.0.0.0 0.0.0.0 Ser.2/LAN 130.75.75.16
#
192.168.0.104 255.255.255.0 EtherNet 0.0.0.0
0.0.0.0 0.0.0.0 EtherNet 192.168.0.1
```

And here is mine:

```
# For an attached Ethernet the gateway entry specifies the gateway out of #
the Ethernet, for a serial line it is simply the host at the other end.
#
# It is advisable to finish the table by a default route. This route is most
# easily obtained by specifying a network 0.0.0.0 with a netmask 0.0.0.0.
#
# Routes with invalid addresses or absent ports are ignored.
#
0.0.0.0 0.0.0.0 EtherNet 192.168.1.1
#192.168.1.201 255.255.255.0 EtherNet 192.168.1.1
#
192.168.1.1 255.255.255.0 EtherNet 0.0.0.0
```

See the difference.

It is the only thing I can see that is way difference from my setup. I use Sting 1.25 on a STe.

>CHARLES

It is possible if you can find a printer that uses the same printer port and if you have NVDI 5. The exact printer may not be lised in the NVDI printer driver list, but you could try a similar one and it may work. My wife has a HP laser printer that she uses on her PC. That particular printer is not listed in NVDI's list of driver, so I starting choosing some HP laser printer drivers and testing them until I found one that worked.

Hello Jim,

I may have done something wrong when I tried to back up my Mint partition
using CD Back/CDISO. It did the backup fine, but the binaries on the CD were
not executable, but plain files. Now that I now it works, I must have not set
the program correctly. So I will try it again. Thanks for the information.

That's quite handy to know, that externals do work. One thing I did
note was that different manufacturers wire them up juuussst slightly
differently. It was originally thought that all GND's / odd pins on the
FDD connector were common. I noticed that some drives would work in
some enclosures but not others so laid them all out bare on the
living-room floor and multimeter'd the lot.

Hi again,

Just adding here as have been away for a few days, well, been perfecting this PS2 mouse code for the ST as have a deadline on that.

I AM going to photograph the MSTE motherboard here, likely on Sunday so will post with a link next. It'll all be part of the write-up I eventually do on this one.

Just guessing that it's going to be an early motherboard since it had TOS 2.05 on it originally...

Aly :-)

3644. Atari ST PS2 mouse interface update

Newsgroup: comp.sys.atari.st
Date: 2005-08-27 10:49:59 UTC
From: techie_alison <techie_alison2000@yahoo.com>
Message-ID: <depggn$e1t$1@nwrdmz03.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 11618

Hello,

Chris and I have been madly working on this so have been a bit quiet lately. Development has gone well and is 99% complete, the other 1% being that Chris hasn't managed to break it yet and procedures have gone through several revamps.

The code is ultra ultra robust. (visions of buying various computer add-ons with quickly hacked drivers etc. We don't want that at all, as creates problems for you, and ultimately a bad reputation for us if trying to sell it, also we're going to be using the thing too...)

Below is the .txt accompanying the latest release of source code. Happy reading... :-)

Oh, PEST, as we came up with (doesn't everything have a quirky name...) is the anocrym for (P)s2 (E)numerator for the atari (S) (T).

Quite happy with the mouse disconnection/able to change mice capability too, as the PS2 standard and Microsoft states that it's not officially supported, creates all sorts of problems... Repeatedly try it on your PC with it powered up..., upsets USB mice too, and PDA's... Mostly related to current in-rush surges upsetting the electronic MCU's, or that's the official line from IBM.

"

Notes to accompany pest_027.
============================

Intended additions to this version.
===================================
;no major code additions or modifications intended. full functionality has been achieved.
;
;final code refining will occur.

Product features (nearing very final release).
==
1. Enables any PS2 mouse to be used with the Atari ST bus mouse standard
2. Scaling modes are selectable to change the speed of the mouse
3. Current scaling mode is retained after power is removed
4. Setup-mode only hides button presses from the live Atari ST
5. Setup-mode allows full mouse movement thus allowing speed previews
6. Disconnection and connection of the PS2 mouse is possible
7. Mice may be changed while power is on
8. Mouse errors and syncronisation issues are fully recoverable

```
9. Compatiable with ALL designs of kvm switchboxes
10. Heavily tested and robust code, repeatedly and randomly attacked

Procedure for changing the mouse speed.
=======================================
1. Both mouse buttons must be held continuously for 5 seconds (time not
finalised)
2. (a virtual box will be drawn on screen to identify mode-entered)
3. Both mouse buttons must be fully released prior to further processing
4. Pressing the left mouse button will select the next scaling mode
5. (a virtual line will be drawn on screen, details follow:)
:mode 1 = line drawn right
:mode 2 = line drawn right, and then left
:mode 3 = line drawn right, left, then right
:mode 4 = line drawn right, left, right, and finally left
6. Both mouse buttons must be pressed once to begin exiting setup-mode
7. (a virtual box will be drawn on screen to identify mode-being-exited)
8. Both mouse buttons must be fully released before real button control
is restored

Mouse disconnection routines.
=============================
;the code for successfully identifying a mouse disconnection is
complete.
;
;this is broadly achieved by the following process:

After startup...
1. timer0 is initialised to countdown approximately 2 seconds
2. Host waits for device to bring clock low in preparation for new
movements
3. If device times out, then request a status report from the device
4. If status report identifies that reporting is disabled, then reset
the chip
5. If status report identifies that reporting is enabled or no timeout
was detected
while requesting the report, restore processing and wait for further
input packets
(normal process, 1. begins again...)
6. If a further timeout occurs during status reporting, then reset the
chip

;it has been found thus far that the above method is reliable and does
not impact
; on any normal flow of processing.
;

Quickly disconnecting the mouse and reconnecting.
=================================================
;this is documented here as it was found to be an issue.
;
;in the previous version of code, the device was simply polled for a
```

```
response to
; a command.
;
;timeouts take 2 seconds to run their course.
;
;if the device was reconnected within this 2 seconds, it would still
reply to the
; poll as any ps2 device immiediately would after power on.
;
;the wrong command was chosen to poll the mouse. a command was needed
which would
; identify the mouse as not reflecting the specific initialisation
process performed
; during normal chip startup.
;
;the status report (0E9h) command was deemed to be appropriate, testing
bit 0x05 to
; determine if stream reporting had been enabled. this would only be
the case if
; the device had gone through our own initialisation process.
;
;the chip code now correctly detects when the mouse has been
disconnected. this has
; been found to be stable and reliable.

"
```

Awwwwwwww :-(

((((((((((((hugs))))))))))))

Completely and utterly dismantle it. Power the mothboard while out of
the case to do your diagnosis. Press all of the chips in. Also, plonk
the plastic case into a hot-hot bath for a few hours to get the plastic
maluable again, the metal can be straightened out. Toothpaste and a
nail brush/tooth brush work wonders... Those keys should hopefully
press back in... just removing some of mine... mmm, see what you mean,
the plastic stumps have broken off of the bottom of some of the keys..
Use 24hour araldite glue as seems less brittle than the rapid stuff..

Really feel for you, I can imagine how upset you must be after the
anticipation of getting it. Had an STE turn up like that from eBay,
although I suspect the seller had under-exagerated it's rubbish
condition,
http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&category=38597&item=8195
234732 Actually, there was ALOT of damage to the casing, and it was

very horrible yellow. The one in the picture I don't think is the one I had...

You'll get it to work. :-)

Why but you do need them tell your wife. It's either those or Windows PC's, and they come with added stress too. So, you'd be obsessed, and really moody too. ;-) Not what missey wants. :-)

My wife posed a theoretical question to me the other day; "if I said me or your Atari(s), one of us had to go, what would happen?"... I gave her a big sloppy kiss/hug, cheezy grin, and told her she knew the answer to that question already. Satisfied, she went out of the room...looking back over her shoulder...and again....and again.... :-)

In the Cambridge UK area, or closer towards Ipswich, Suffolk??

If I may borrow your Amiga, RGB Scart cable, and Amiga mouse for a few weeks you'll get a PS2 mouse to Amiga interface in return. (with the original Amiga kit naturally).

Need to do some testing on this PS2 mouse thing we've done. The code is in place for Amiga operation but hasn't been tested, so therefore is currently disabled.

Ta,

Aly

3666. TeraDesk 3.62 released

Newsgroup: comp.sys.atari.st
Date: 2005-08-28 00:47:06 UTC
From: vdjole@EUnet.yu
Message-ID: <der1i8$as0$1@news.eunet.yu>
Source record: 11643

Version 3.62 of TeraDesk open-source desktop is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

This is a bug-fix update. Some con-critical bugs were noticed only after
the release of V3.61, and they have now been fixed.

See the history file and the hypertext manual for more information.

Have fun.

3667. Re: Toasting MiNT

Newsgroup: comp.sys.atari.st
Date: 2005-08-28 01:53:26 UTC
From: Jim DeClercq <jimd@panix1.panix.com>
Message-ID: <der5em$6g$1@reader2.panix.com>
Source record: 11644

We need to break this down into smaller details.

To write a CD, select MiNT and Unix compatibility, which will get permissions and flags set properly. For me, with a 32 MhZ TT, I need to boot MiNT into single TOS to reliably write a CD, and I can do 4x. Otherwise, 1x is iffy.

If you did that, keep that CD. The difference is in getting the files moved back.

The last time I did this, I used two separate methods to move files back. And that missed two things, which I needed to fix. Teradesk does not balk at long file names far down in the directory structure, which is nice.

Copy everything with the latest version of Teradesk you can find. Then, if needed, re-copy bin, sbin, usr sbin and usr bin, and X11, which I think is in etc. That may still miss wtmp, which is in /var and both copies need to be writable.

For copying the binaries, I used Thing, which is my regular desktop. This second step takes very little additional time.

Oh, the other thing? N_aes writes a copy of itself in bin, I think, and does not set the program flag. My MiNT configuration file seems to look there first, and will not look further because the name matches. I have set that thing to binary executable several times.

I know nuttin about the latest version of Xaaes and its file selector, and what it uses for copy routines. Have heard good words, have not used it myself. That should handle copying permissions and flags OK.

The bottom line is that you may need to copy your binaries separately, and may miss one or two things that need to be either writable or executable.

Jim

> 192.168.0.1 255.255.255.0 EtherNet 0.0.0.0

I've not had a chance to try any software to actually access the 'Net yet, like CAB/Highwire, ftp programs, Newsie, mymail or whatever...but, using the above in my route.tab file, I was able to ping the other computers on my LAN and other comps on my LAN could ping this comp at 192.168.0.104.

Thats the good news.

The bad news (so far) is that when I try to telnet into that comps ip address (192.168.0.104), the connection is refused. This is with my BBS software up and running, which works fine with the Lantronix device.

Anyone have any ideas how I can make my BBS software recognize the "incomings" from the STing/cartridge port combo?

Thanks much.

I have already done that Joe. Some time ago infact. Roger said he was in the
process of doing it. I do not know just how far along he is though.

Yes, that is how I backed up my Mint System. I put together a lot of tar.gz
files. Worked fine, but I would rather have something like CDISO or CDBackup
do it.

Did you check all the settings in STING? I would think that may have to do
with your problem. What modules do you have in the STING folder?

I'll keep my eye out.

Actually the Falcon is not in too bad a state, just need to get my
hands on a MagiC manual and dust off my Atari skills which have not
been used in 10 years and then only on a 520STFM.

The TT however is in a bit of a state and does need wiping and
reloading. Are there any alternatives to MagiC?

Thanks
Dave.

Ahem.. Whats wrong with tar? You tar your MiNT partition and thus save all flags and symbolic links, etc? All u need is to add mke2fs and tar to your rescue floppy. On CD u may even put small MiNT XaAES/NAES setup (kernel, aes, desktop and tools like toswin2, mke2fs and tar (rename those to .TTP) and that is all. Basicaly, u may duplicate your C: MiNT files. Its even possible sqeeze that on a floppy :) If u wana boot MiNT from CD then, just edit mint.cnf to suit your CD rom drive..

If panic strikes you just boot from CD (or copy files to C:, boot) in MiNT, mke2fs new mint partition and untar MiNT backup there. Easy, and safe backup.

Also, most MiNT "problems" are actualy TOS filesystem problems, where C: drive get corrupted and so mingle mint.cnf etc.. So simple backup of mint kernel and mint.cnf + few drivers is usualy enough... and just copying that back to C: solve issues

More dangerous problems are when some app destroy mint partition bootsector, but even that is usualy user error :) Full MiNT backup is wise then :) and i thin tar is best option...

From: blah@blah.com
Message-ID: <i394h19i9au757a0p0i4nonet554rtfncg@4ax.com>
Source record: 11560

Hi,

Anyone know if there is an online version of a TT user guide? I'm specifically looking for info on which HD program (format / partition) I need to use.

Is the the best forum for responses? Like I siad in a previous post it's been 10 years since I've used an Atari and things have changed quite a bit - I've a lot of questions :-)

One further question and I know there will be no simple response... Is it possible to put a TT or Falcon on a home network (router) and get access to the www?

Thanks in advance

Dave.

http://europeshareware.free.fr/scripts/visu1.php?Langue=n_a&editeur=1
It's on the ASH page.

But I suggest going with EASYMiNT.. Magic is $195 USD

There is nothing at all wrong with tar. As long as you remember the -f, it works admirably well, if you have room for the tar file and the iso file needed to put the tar file onto a CD. And room for the tar file and its untarred self. I do. But if all goes well, it would be one extra step, although a very stable and well supported step.

If there is a next time, I will try tar. Cannot hurt, may turn out to be faster and easier.

Thanks for the reminder.

Jim

No, yes, yes, and yes. The devil is in the details.

Buy HHDriver. There is no better HD program.

The easiest ethernet card fits the cartridge port, and is sold on E-Bay
for the same price as direct. There are others, and more expensive, but
some people reading this list have used the Ethernec for your purpose.

Hallo,

ich habe seit einigen Jahren einen Atari 1040 und dazu die
Sequenzersoftware Cubase (3.01) (Original mit Dongle, ...). Nachdem ich
den Rechner nun einige Jahre nicht benutzt habe, wollte ich die
Software wieder nutzen. An sich geht auch alles (Disketteninhalt
ansehen, Programme starten) aber Cubase startet zwar und baut den
üblichen Bildschirm auf, bleibt aber offenbar ganz kurz vor Schluss
haengen (Cursor ist eine Biene).
Was koennte das sein ? Probleme mit zu alter Diskette ? Probleme mit
altem Dongle ? Probleme mit altem Atari ?

Fuer einen Hinweis waere ich dankbar

Gruss
Klaus

The ethernet cartdridge is called Ethernec. A quick search on this group will turn up tons of hits. A guy called Rory McMahon (sp?) is now making them. He does tend to put them on ebay. If you need Ethernet capability now then I recommend this route.
If you have a Falcon and/or TT and you want Ethernet AND USB, then you may want to wait for the CTLink. However, If you've got tons of cash I would recommend putting your name down for a CT60 accelerator, and buy an EtherNAT from Nature.
CT60 and CTLink = http://www.czuba-tech.com
EtherNAT = http://nature.atari.org

The EtherNAT is ready to go into production now, the CTLink is ~3-6 months behind.

Coda.

Hi Klaus!

Try to clean the contacts of your Dongle! With a Kontakt-Spray or a
MOS2-Oil.

There is also a german newsgroup for ST/TT.

Best Regards,

Daniel Mandic

3698. Thing desktop removal

Newsgroup: comp.sys.atari.st
Date: 2005-08-29 12:41:38 UTC
From: blah@blah.com
Message-ID: <bf06h19nbai0qnnenvkb9tb86f6kv1hrea@4ax.com>
Source record: 11571

Hi all,

Can anyone tell me how to remove Thing desktop from a Falcon? I
renamed the Thing109 folder to ThingXXX and now whatever set I use in
X-Boot I still get errors about Thing not being found. I guess this
is more of an X-Boot question really.

Thanks in advance

Dave.

Only two enabled program; XBOOT.PRG & TOS4_FIC.PRG

Two folders:
Assign
assign.old
assign.sys
telnet.sys

NEWDESK
Lots of .INF files two being THING256.INF & THING16.INF

Do these need to go?

Dave.

> faster and easier.

Hmm, why u need room for both? U can create normal data cd, and put needed files: auto folder, mint folder, aes, desktop, mke2fs and tar. And the x.tar itself of course :) U may even edit mint.cnf and aes.cnf and u get bootable cd. Or leave all settings done for C:.. If C: drive gets corrupted u fix it and copy MiNT files back. If MiNT partiton also get corruopted, u then boot to MiNT, make ext2 partition and untar MiNT archive to newly created partiton. So its wise to add cdrom drivers etc as well to rescue cd :)

Janez

P.S: yes, it is additional step, but it does preserve links and stuff..

I've removed all reference to Thing from the default set in Xboot and
it still complains. The default set is very minimal with only the
following selected:

PRGs
===
XBOOT
MAGXBOOT
NVDI
TOS4_FIX

CPXs
===
General
MAGXCONF
NVDICONF
TRASH

No ACCs are selected.

Dave.

Have you checked whether Thing has been selected as Autostart
application? I don't know the name of the menu item/option for the
English version of TOS, but you can configure an Autostart application
somewhere in the standard GEM desktop.
In order to change this you must first prevent Thing from being booted,
so that you can change the setting in the standard desktop.

As an alternative, load your C:\NEWDESK.INF file and remove any line
where 'THING' appears. Or (maybe the simplest solution for you) just
delete NEWDESK.INF. You can create a new one any time with your own
settings.

Source record: 11584

Hello,

Following the release of SDL 1.2.9 this week-end on various systems (http://www.libsdl.org), here is the Atari version, for people wanting to develop programs for various platforms. You can download it from my website (yep, I know, still no RPM version).

First, I whould thank all people that help me fixing bugs and doing tests on their systems.

- Better detection of system to enable/disable various drivers.
- Timer layer: release CPU when waiting under MiNT.
- Gem video driver: huge number of bugfixes.
- IKBD keyboard/mouse/joystick driver: many bugfixes.
- MCSN audio driver: uses a thread under MiNT.
- Xbios video driver:
support for Screenblaster 3, Blowup and Centscreen on Falcon.
many bugfixes.
- Xbios audio driver:
support for FDI interface: both clocks and external output.
uses a thread under MiNT.

Reporting back. According to Hypercopy, it sets Add Headers to Yes, which does not read on a Dell box, and Discus sets it to No, and that does read on a Dell box.

What is Add Headers for?

It seems I need Discus for many things, and Hypercopy to tell me what is wrong with a disk format. Still no word from the author about registration.

Message-ID: <pTOQe.4683$R5.807@news.indigo.ie>
Source record: 11597

Here's information on an new retro magazine you all may be interested in:

The Digital Alternative is an interactive magazine presented on two professionally produced CD-ROMS covering retro / alternative computing and gaming at its best. Each issues, supplied on 2 CD-ROMS, will have over 4 hours of video footage and over 200 pages of articles covering all aspects of retro and alternative gaming/computing.

The retro aspect of the magazine coves home computers and consoles from the 1970's, 80's and early 90's which basically means every retro format you can think of. There will also be alternative content, meaning contents about the CPC-NG, Commodore One etc.

The cost will be 5 Euro (US DOLLARS: $6.10 or STERLING: £3.40) plus the cost of postage and packaging.

We are ready to produce the launch issue but first we need the number of CD-ROMS and Inserts to produce. So if you're interested then register your interest at http://www.digi-alt.net If interested it's important to register your interest as not to under/over produce the CD-ROMs. We plan on finding the number of people interested (by registering their interest), add 10 percent, round it off and produce the result.

You can go to the main site http://www.digi-alt.net to find out more information on the contents of the first issue.

Regards,
John

This is from memory, but I believe I'm correct:

First set: What addresses may be reached
Second set: Masking (0 = strip, 255 = keep)
Third set: What port to use
Fourth set: What gateway computer (router) to find

Thus, 192.168.0.104 255.255.255.0 Ethernet 0.0.0.0
would mean to send any data intended for 192.168.0.xxx out the Ethernet port and to use any available computer as the gateway. (So why did you write the .104?)
Then 0.0.0.0 0.0.0.0 EtherNet 192.168.0.1
would mean to send any other data out the Ethernet port to the computer 192.168.0.1 (your router). Since you intend to send all data out your Ethernet port, I think that you just need the default (last line), although you might also try:
192.168.0.0 255.255.255.0 EtherNet 192.168.0.1
0.0.0.0 0.0.0.0 EtherNet 0.0.0.0

One important point -- there are no spaces in this file! What appear to be spaces MUST be [TAB]s.

I can't guarantee that this will work, but it's my best shot at the moment.

Galen

OK, now I'm confused.

If your computer has address 192.168.0.104, wouldn't

0.0.0.0 0.0.0.0 EtherNet 192.168.0.104

serve to send all data packets back to your computer?

Looking for Non-Working Atari Falcons.

If you have a Falcon that doesn't work anymore and want to
sell it. Contact me at the e-mail address below.

Also, I may be interested in a working Falcon, depending on the
condition and if it has been upgraded or not.

If you have one for sale, contact me at the e-mail address below.

Also interested in 3rd party hardware for the Falcon of all types.
Working and Non working.
Contact me at the address below if you have Atari Falcon hardware
to sell.

I am located in the USA, and will buy from OverSeas and CANADA.

E-Mail me a description of your item and asking price to me at:

phantomm@bellsouth.net

Thanks,

One can do all kind of things as far as formatting floppy disks is concerned. "Add Headers" thus can mean a lot. Old versions of DISKUS offered special formatting features where you could influence the number of bytes written to certain locations within a track, or analyze a track layout. These features are not available in the current versions anymore because they only work with the Atari floppy hardware and not with emulations like MagiC or with the Milan. Besides that, execpt for creating track formats not compatible with any platform these functions were not really useful, and so I removed them. (Registered users can get an old version of DISKUS, of course, where these functions are still available.)
Anyway, obviously it does not need complicated options to format a floppy with DISKUS in order to be readable on a PC :-).

Probably u use the original AES (built in tos), since every AES I can think has "AES" in its name (NAES, XAAES, OAESIS, etc..) I've NAES and there is a cfg file of it which tells him which desktop to start automatically. Since you have the original AES my only idea is the desktop.inf file. Applications also can be started from this file. Try to rename it.

Actually who complains about the missing Thing? Is it XBOOT? Or something after XBOOT? What happens if you disable XBOOT?

PeST.

Yes, that would be possible although possibly impractical. The PCB
mouse PS/2 connectors are a little tight so some concern about quality
control when we were speccing. The idea with the PS2 extension cable is
the any gubbins such as PS2/USB converters can be dropped down behind
the desk etc.

Had a choice of these or these;

http://www.maplin.co.uk/Module.aspx?ModuleNo=1111&doy=30m8

http://www.maplin.co.uk/Module.aspx?ModuleNo=1115&doy=30m8

The other option is to have a very short extension cable. Silly thing
is that the sockets up above are more expensive than a 2 metre ps2
extension cable which is chopped in half.

>

Not really. In the Sting Port CPX file there is a save option. I just clicked
on that and it saved it to the hard drive. Try doing it a few times just to
make sure it does the job.

>Regards, /Peter/

Under Magic I first use the gzip.ttp program (-d option). That will give me a
tar file. I then use Arcview(which I have setup to work with the tar.ttp file)
to get the files inside.

I think people have managed to take a couple of different routes and still
get things working. I've seen where MagiC! users have succeeded with STing.

IMHO, still the best Atari environment and desktop would be MINT and Thing.

Galen, you're right. With it set the way I had it, I could ping localhost at 127.0.0.1, and I could ping the machine (even from another ip address on the LAN) at 192.168.0.104, and I could ping other machines from the Atari. However, no apps would work. CAB, NEWSIE, etc, just time out.

I reversed the 192.168.0.1 and the 192.168.0.104 in the ROUTE.TAB file and now CAB and NEWSIE work. I was able to load up Google. :-)

Thanks.

Okay, if you read my message to Galen, I had to reverse part of my ROUTE.TAB files settings, but once I did that, CAB and NEWSIE both work. I was able to load up the Google search site in CAB. Hurrah! :-)

> Did you check all the settings in STING? I would think that may have to do
> with your problem. What modules do you have in the STING folder?

Apparently this is not a STing problem. Its my BBS software. It doesn't access anything tcp/ip (if I'm using the right terminology here). It looks for signals from the serial port only. Thats why it works with the Lantronix UDS-10, which converts those signals. It appears at this time that a rewrite of the code itself would be required. I can still use the BBS via Telnet just like always, just not as fast as an EtherNEC would have allowed it. :-(

Thanks for the help though.

Okay, its all working but I have another question. What do you have to do to make the settings "stick"? I mean, after a poweroff or reboot, I have to go into the STing Port CPX and reset everything. I saved, both general and address to STING.PRT, in the C hard drive. Doesn't make a difference though, if I reboot, I have to use the CPX again.

Any ideas? Thanks!

Yes, if it fits, and if it's all lines are connected straight through.
The biggest issue is likely to be if the connector fits the ST without
chaffing on the case.

One way to find out :-)

We was going to have at first the mouse connected direct to PeST, though the PS2 plug is too wide in general so the ST would end up resting ont he PS2 connector rather than the ST's feet. After a very quick chat to people, they prefered a extender cable anyway, of course we all like our port extenders so everyone is happy there.

>

Id you use a "though" cable will al 9 pins connected it can work... though a normal RS232 cable will not work, TX-RX and handshake lines will be crossed over and you will have a nice reversal of mouse movements.

I think Alison maybe making some "in cable" types for those who want to do that kinda thing. The board I am developing just plugs into the port under the keyboard as show on my site http://www.cps-electronics.co.uk/web/PS2.htm that is with a few inchs are PS2 extender cable.

hmmm, not sure if those plugs will fit... prossible... though the screws may need to come off and its posible the plug itself coudl be to wide or too long... A generic DB9 only *just* fits and thats without any plastic housing around it.... I would bug Alison for those in lead adapters ;-)

The patch is in the aranym cvs.

> I'll see if I can find the topic in my NG/ML archives.

From the aranym Mailinglist:
```
-------------------------------cut-------------------------------
PC.PRG can work with files in memory (opened windows). Unfortuantelly it uses
file handles between 100 and 140. MetaDOS maps the opened files just from the
value of 100. So, the solution to make PureC working with MetaDOS or BetaDOS
would be to patch them of PureC.
.
.
.
I've been investigating the MetaDOS filehandle numbers and I've found out
that MetaDOS can only open 100files simultaneously. So I've made a patch
to let PureC use the handles from 200 to 240 for memory buffers. The
patching prgram is in src/atari/tools/pcpatch.prg.bz2 (pcpatch.c).

Hi Janez!

I don't think that's right - Thing is not included in SETS.DAT! At
least it isn't in mine on the Falcon (though I use V1.29).

But if he is using MagiC, he will have to delete the line

#_SHL C:\THING\THING.APP

(or whatever the path was - mine is in D:\THING\) in the MAGX.INF
file and possibly substitute an entry for an alternative desktop
if he isn't using MagiC's own.

If he is *not* using MagiC, then I don't know where the message
comes from. Perhaps a rename to OLDTHING rather than THINGXXX might
work?

Hi,

Xboot has a field name "Autostart" where u can select an application which
will automaticaly start after boot.. If Thing is set ti Autostart, Xboot
will complain that Thing cant be found...

3754. New Versatile Disk Image

Newsgroup: comp.sys.atari.st
Date: 2005-08-30 19:51:28 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <4314b8c0$0$7863$8fcfb975@news.wanadoo.fr>
Source record: 11525

Hi all,

I just uploaded <http://eureka.atari.org/xa-my-aes.zip>.

It's a versatile boot disk image for ARAnyM ... It
means that it runs 2 AESes (XaAES & MyAeS) and that all
is done to switch from one to the other easily ...

This image is compatible with AFROS disk image. That
means that you can replace "disk.img" from AFROS and
that all should work as ever :)

The new features are :

- EmuTOS snapshot from 2005-07-12
- upgraded configuration files
- freeMiNT snapshot from 2005-08-19
that means fresh kernel and AES
- zView beta 6
- Teradesk 3.62
- MyAeS 0.68

Have fun !

Regards,

Since my OLR crashes when I try to do a Comment to Ed Baiz's
posted message <43119978862a04@comcast.net>, I am sending this as
a new Say:

>Yes, that is how I backed up my Mint System. I put together a lot of tar.gz
>files. Worked fine, but I would rather have something like CDISO or CDBackup
>do it.

For someone who is not Unix/Mint savvy, can someone please explain
to me why you need to use both tar and gz. What do they do
individually? I assume gz is GZIP and like any other ZIP, but what
does tar do?

And how do you handle *.tar.gz files under TOS/MagiC? Do you first
unzip them and then detar them? ArcView has facilities for both,
but in which order do you use them?

Thanks for any explanation!

Regards, /Peter/

> does tar do?

tar creates an archive, without compressing the data. It appends all
files and adds information so that it can detach them later.
gzip does the actual compressing. When using the GNU tar implementation
(most likely the one for MiNT) one can combine these two operation into one.

> And how do you handle *.tar.gz files under TOS/MagiC? Do you first
> unzip them and then detar them? ArcView has facilities for both,
> but in which order do you use them?

With GNU tar one can decompress the archive and decompose the tar file
in a single step:

tar zxf filename.tar.gz

This is the same as running

gunzip filename.tar.gz ; tar xf filename.tar

Note that in the one step process the original file is kept, whereas in
the two step process the .tar.gz file is removed and replaced by the
uncompressed .tar file.

> individually? I assume gz is GZIP and like any other ZIP, but what
> does tar do?

tar archives a set of files in one tar-file, preserving access-bits,
datestamps etc. It doesn't compress though. gzip is a (de)compression
tool, but it can only compress one file.

Example:

tar cf drive_c.tar /c/*

will make an archive called drive_c.tar of your entire C-drive, but it
won't compress anything. To compress this archive you can use gzip:

gzip drive_c.tar

This will also add a .gz-suffix to the archive. You can also do this in
one step:

tar czf drive_c.tar.gz /c/*

> And how do you handle *.tar.gz files under TOS/MagiC? Do you first
> unzip them and then detar them? ArcView has facilities for both,
> but in which order do you use them?

To depack you first decompress the archive...

gunzip drive_c.tar.gz

...then unpack the archive:

tar xf drive_c.tar

Or in one step:

tar xzf drive_c.tar.gz

I thought I would add that gzip a way to compress a single file.
(A .zip file is a container of multiple files that is compressed - with
.tar.gz files the TAR is the container, and the GZIP part is the
compression).

Coda.

Hi everybody,

I just got an ITT TV2466 stereo tuner. It once was intended to watch TV with an Atari monitor. Unfortunately, I don't have an instructor manual.

Can you tell me anything about it?

In particular, I'm interested in the following:

- I would like to use the TV2466 limilar to a TV receiver of an VCR, where the eight channels are switched to the one channel of the TV tuner. Is this possible? How to find the channel of the tuner?

- What is the meaning of the LED's. OK, I guess the left one indicates that the tuner is set to a channel and the right one indicates mono/stereo. But what to the upper and the lower indicate?

Thanks, Uli

Atari Workshop in the UK.

Better, get the original floppies from the vendor!

Or back up the C drive and then copy back after you've formatted the drive.

Just as a reminder: Formatting a hard disk drive that has no bad sectors
is a waste of time. Partitioning is sufficient and much faster.
Formatting (always meaning low level formatting on the Atari) yields the
same result on any platform because it is done by the drive, not the
operating system. The only difference between platforms is the file
system layout, which is created when partitioning, not when formatting.

Hi again,

If I run it on plain TOS, no environment variables set, it runs dog slow or not at all.

In MiNT, with the following settings, it is really fast:
SDL_VIDEODRIVER = xbios
SDL_EVENTDRIVER = ikbd
SDL_AUDIODRIVER = mint_dma8 (none of the other drivers seems to work on my setup)

Machine: FreeMiNT/Xaaes (latest alpha), CT60@100Mhz/25Mhz bus, NVDI 5.

The sound is heavily distorted, and it only works in 16bpp. In 8bpp, the palette is totally screwed up - but that's a problem with my setup rather than doom. Would be nice to try it in 8bpp though :-)

Thanks, thanks, and thanks again Patrice!

"tar" came from UNIX, where it meant "tape archive". UNIX also has
a utility called "ar" for "archive". This was mainly used to create
libaries of binaries to link with programs. So the name "tar" is
an off-shoot of the name "ar".

Just wondering, the convention at one time was that low-level formatting
SCSI drives was okay but big no-no for IDE stuff. Is that still the way it
is?

Thanks!

I would just add u can only use one step method (adding "z" to tar
comandline) in mint/unix shells, maybe also in mupfell shell in TOS. So
if u use magic u must tar and pack/depack separately.. Also u will proly
run on gzip only so 'gzip blah' will make blah.gz. To depack u just use
-d flag: 'gzip -d blah.gz' will depack it. Note, that in unix command has
no endings, so gzip in unix, equals gzip.ttp in tos/magic.. For gzip/tar u may
ask any MiNT user, cause command line programs in MiNT works happily as .ttp in
TOS..

It is OK for SCSI drives, but does not result in anything useful if the
drive has no bad sectors. Formatting in order to use a PC/Mac/Unix or
whatever driver with the Atari takes time but does not have any benefit.
Partitioning is all that is needed.
As far as IDE drives are concerned only very old drives may be damaged
when formatting them. But as far as I know this has not been an issue
anymore with drives that are not older than 5 years or so.

Well I have low level formatted several of them without any problem. But
in general the JAZ stuff was not very reliable. Even without
formatting many cartridges get broken easily, start to make noises etc.

Thats interesting. I formatted 1, once, and killed it straight away.
Found out later that there is a special part of the disk that the heads
use for positioning, once thats gone, the disk is toast.

Hi Ronald,

Thanks for the info, I'm going to try MiNT on the TT. Must admit I
didnt like Thing all that much, the bit I saw of it anyway. Is it
still supported because the version I had was unregistered shareware.

Cheers
Dave.

Hmm, I don't know if its *officially* supported. I believe the author was released it now and doesn't require a registration anymore. Someone will correct me on this if I'm wrong.

Can you say specifically what it was that you didn't like about it? I have to admit, after going from a plain TOS desktop, then to Neodesk/Geneva and then to MINT/Thing, it took me a while to get used to it as well. Its very robust. There are lots of options, which can be confusing at first, but you're better off in the long run.

Hi Janez!

Yes, you're right. But it doesn't seem necessary to have Thing
entered there - mine runs without that under MagiC.

Without MagiC, Thing can also be installed as an application to
start automatically. From the HYP:
----
1) Select file THING.APP
2) Select 'Install Application...' (or similar function in your desktop)
3) A dialog box appears to register THING.APP.
4) Set 'Boot Status' to 'Auto'
------
and there should be a

5) Save the desktop!

If he has done that, then a renamed Thing folder will give rise to
complaints as described. The remedy is to remove the line such as

#Z 01 D:\THING\THING.APP@

from DESKTOP.INF or NEWDESK.INF.

I can't display JPEG images with Papyrus and CT60 in 060 mode.
I tried the demo versions and my latest version (PAP X), and it's exactly
the same: instruction error everytime a JPEG appears.

Everything works in 030 mode.

I tried clean booting, and it's the same.

Any hints?

Thanks in advance

Paolo

A 68060 lacks a few instructions.
Look out for a software package that emulates them.
I dont have a name.

Such a package should be part of the CT60 deal, it also emulates
a series of lacking floating point instructions.
Check if such a package is installed.

I dont have a CT60, but I know this from the MC68060 manual.

Dear Classic Computing and Gaming Enthusiast,

Buy, sell, trade, play, and see classic video games, computers, peripherals, memorabilia, and more at the Classic Computing and Gaming Show (CCAG) on Saturday October 22, 2005 from 2:00 P.M. until 7:00 P.M. at the National Guard Armory, 3520 Grove Ave. Lorain, Ohio. Vendors, clubs, and collectors will be displaying and selling their retrogaming and retrocomputing goods, from Pong and Atari to Nintendo, Apple and IBM to Commodore and everything in between with many set up for you to play with and explore.

And once again, it's free, that's right absolutely *FREE*, for attendees and dealers!

We have 5000+ square feet of space. Help us fill it all up! (The price certainly can't get any better. :)

Get the latest information on our website, www.ccagshow.com, or write us at info@ccagshow.com. And don't forget to spread the word!

We'll see you there. It's gonna be great! :)

Well it was a mistake then ;) I don't use Iomega, but Syquest, but
there is no problem if u want to use Iomega. In generaly SCSI HDDs,
CDrom and exchangables feels quite happy with Ataris... On other hand
if u want to use Atari more as for gaming, 250 may be tight anyway .)

Thing need a short period to get used to it. It is not emediate eye
catcher. Also supplied icon set isnt that nice, but u can change those
easily... Strong points are shown later: thing groups is great feature,
also Things "application" dialog is very good, fast acces to apps, and
"sendto" feature are also very usefull. Also offer good support for TOS
and Unix (minix and ext2 used in MiNT) filesystem. Also skiping folders
is nice, but sometimes i miss "spring folder" feature as in Jinnee, but
thats rare.. It is also great AVSERVER, so offer nice features in multi
tasking envoirments...

So u dont know, that CT60 TOS take care of that :) Anyway, all works
perfect here, Papyrus 8 though. I would say that Paolo has FPU less 060
maybe?

Hi,
The Falcon I bought has a registred version of MagiC 5 on it and that works fine, it also had an unregistered version of Thing which displayed "Shareware" all over the desktop. The shutdown option from within Thing always "hung" when powering down.

I kept getting a message on boot up saying opened windows would not be saved in this shareware version. That coupled with the fact that I dont have the install disks and could not find it on the net prompted me to disable it.

Are the installation disks available anywhere on the net?

Dave.

I sometimes get errors when I boot up Papyrus X on my Hades 060. The thing
that works for me is either boot the computer under regular TOS or else boot
it in the 256 color mode. I usually run things in the 24-bit mode.

I can go along with that. I use COPS on Hades which seems to work fine, but on my STe I use the Zcontrol panel.

It's a complete 060.
I am running it at 95MHz.
(I had the same problem before Rodolphe Czuba upgraded it from a 50MHz)

Someone else suggested to try the TT bit with the fileinfo utility (nothing happened)
Someone said it could be because of too much memory (I have 256), but I don't know how to 'reduce' it.
Another option was the speed of CT60 (I didn't try this one yet)
And another sugout the JFIF module (I have to try the TruePaint one, I need to search.

In the meanwhile, thank you guys!

>to me why you need to use both tar and gz. What do they do
>individually?

Other have already explained what tar and gzip components do, but maybe some words would be usefol on why it is beneficial to execute such a procedure: it comes to advantage when a (large) number of files containing identical or similar data segments are packed. Tar conveniently puts all files into a single .tar archive, and then the compression algorithm in the gzip part can compress identical sequences which appear in different source files, and also compress the archive directory, etc. This can result in a compressed archive which is noticeably smaller than if compression was done on each source file separately as, for example, in zip.

When a single file is to be compressed, differences in compresion ratio vs. some other archivers are more-less academic.

>I assume gz is GZIP and like any other ZIP, but what
>does tar do?

Btw. as far as I know 'gzip' format is not identical to 'zip' one, though it is based on similar principles.

Thanks very much to all who replied to my query here and by mail.

I hadn't realized gz only handled one file at a time, unlike ZIP
on the Atari (or WinZIP on a PC?).

Regards, /Peter/

Howdy,

I'm having issues with COPS in Xaaes/FreeMiNT 1.16.0 - 1.16.CUR.

Cops starts up, but crashes when it loads CPXs. Doesn't matter which
CPXs, and fooling around with the memoryprotection settings doesn't
help either. I've tried starting it both as an APP and as an ACC.

I can ofcourse use zControl, but I want to use COPS.

Any clues?

regards

> don't know how to 'reduce' it.

I once tried changing the Memory settings (under the Options submenu)
in Papyrus while running it on my CT60, and I got all kinds of errors.
This setting may be what the person meant. I returned all the settings
to the original "factory" settings, and everything works fairly well (I
still get an error or two from time to time, but not nearly sa often).

Hi,

The TOS boot Radeon driver (VDI / XBIOS) and radeon.sys for fVDI is in progress. Time remaining, one month I think + time for test / debug with the hardware (today just planed).
PCI (X)BIOS is already finished.
The CTPCI + Radeon 7000 /7500 seems the best choice.
The TOS PCI drivers are loaded inside the flash between 0xED0000 and 0xEEFFFF (128 KB) with the CT60 Flash tool (HEX S-record format).

Regards,

Didier.

Hi all,

Just setting up a Gasteiner HD with an Atari 4160 STE. I've formatted all the partitions, and copied a few ACCs into the auto folder along with the Little Green Selector (LGS) program. Problem is that LGS causes the ST to freeze on bootup and as C is now the boot drive I can't get into disable it. I tried putting a disk in to the A drive but the ST keeps trying and failing to boot from C.

Can't even get in booting from the Gasteiner disks either.

How can I get back into the C drive and disabled LGS?

Dave.

So,

Should we begin shopping for radeon 7000/7500 PCI cards?

thanks,
Mark

Which hard drive software are you using? With HDDriver, and most of the other HD software, you can use a keypress combination at bootup to achieve various things.

Try holding <alt>, <control>, and <shift> in various combinations at boot time. It works, I've done it before as well. I just can't remember the -exact- combinations right now. <grin>

Try them one at a time first, then try 2 key combinations like <control> and <shift> together at the same time.

BTW, sometimes just because it freezes at a certain point, doesn't necessarily mean its the last thing you see on the screen. It probably is what you said, but once you do get back in, be prepared to disable all your ACCs and add one at time back, until you find the exact culprit.

HTHs. :-)

Its in the ROM. Pressing and Holding ALT at boot time will bypass
booting from harddisk, and boot from floppy.

Coda.

Hopefully you are using HDDriver. Just boot up the STe using a floppy so all you get is a desktop with the A and B drive icons. Then run the HDDriver program and install the C hard drive icon. You should be able to get in and ajust what needs to be adjusted. I do it all the time this way when I have a booting problem.

Mike you might do what I do. I keep a copy of the information file in a
separate folder. Then if Papyrus starts to act up, I just copy that onto the
inf file that Papyrus happens to be using.

Hi all,

For the first time since back in May this year, there is now a new development snapshot of XaAES available. Quite a few things have been improved and polished up and the new version is definitely worth a closer look!

Amongst other things there is now experimental support for using texture backgrounds for window widgets as well as support for changing resolution from within XaAES. Add to that a comprehensive list of bugfixes and optimisations and at the end of the day you get a more mature and polished AES. Especially users that wants to use XaAES in monchrome mode should pay close attention to this release.

Visit the Un-official XaAES Page to read more and download the development snapshot: http://xaaes.atariforge.net

Regards,

Joakim

First, thanks to all who responded.

Pressed the Alt key as suggested and did indeed manage to get in and remove the offending ACC. This seemed to work once, now when booting from the HD the system freezes up with the following displayed on the screen.

HHDriver V6
ACSI 0.0 Seagate ST1096N
Partitions C-K, Boot Drive C
27kb.

Pressing any keys now gives two bombs. Tried leaving the system at the 27kb prompt, came back an hour later and it was still the same.

if I use ALT to boot from floppy the STE is unable to see the HDs either by adding them onto the desktop or running HHDriver.

I'm wondering that if I plug the Gasteiner mega drive into a Falcon, could I use HHDriver to mount the HDs and wipe out the entire AUTO folder...? Is this likely to work or would the Falcon try to boot from the "fried" Gastiener instead of it's own internal C drive?

I was trying to setup up this STe / HD combination so I could do a test run of installing MiNT - Didnt get very far :-(

Dave.

You know some people have no life, and sometimes want to bore a whole newsgroup. That's easy: go start flame wars or post insanities to 10 or 20 other active newsgroups, crossposting with the newsgroup you want to annoy.
Within a few days, hundreads of messages will flood the newsgroup you don't like.

Cheers,
Simon.

Okay, I'm a complete newb and utter ID-10-T when it comes to this stuff,
so forgive me if I ask something really stupid, but...since its MINT, and
Nvidia video cards are so well supported under Linux, wouldn't a cheap
Nvidia card be an option?

Just wondering... Thanks! :-)

PS Or is it because Nvidia Linux drivers are still proprietary?

Of course the information file used must be one that has worked before. You want to try the one that came with the program as a start.

Hello Mike,

STZip 2.6 is ok, but it has some bugs. I use Arcview which is a great shell program. It uses Unzip.TTP. I also have LZH,TAR and ZOO incorporated with this. Works great...

Well, the ATI drivers are proprietary and AFAIK , the NVIDIA drivers
that exist for linux are unsupported but they are provided by NVIDIA.

I still say that the Voodoo cards would be the best choice considering
the amount of documentation available, but what Didier does is his
choice.

Wheres the problem?
someone else can write VOODOO drivers as well, I supposed that there is no
problem because all of these will be only compatible with GEM.

Depends on your view of "unsupported". :-) Nvidia releases new updates
for their cards on a very regular basis, and are much easier to work with
than ATIs stuff, at this point, going by the messages I read in the
Mandriva mailing lists. Just wish they would open source their stuff. Sure
would make a lot of people happy. :-)

> I still say that the Voodoo cards would be the best choice considering

The Voodoo 3000? I've still got one of those. It was the first video card
I ever used with Linux, mostly because of its great support, out of the
box, at the time.

Yes, it's not a problem, if someone can bluid a VOODOO drivers, please
contact me. The limit is just the 128 KB of the flash. But if space is
needed I can remove the boot picture and get another block of 100-128KB.
You must also create a driver fVDI compatible who can also can be called
by the flash, use gcc and gas, so please contact me.
If you use Linux sources, we can also use common resources for get space
like the framebuffer functions (cleaned of kernel linux calls).

Regards,

Didier.

Today I don't know, if fVDI works on theses machine why not, but I think use the CTPCI in big endian (today there are a define inside the PCI (X)BIOS). So the radeon driver is little endian whith a result in big endian. On Milan I think than the host bridge is big endian and the ati card is set for swap bytes. The result is the sound that the milan blaster is in intel format :-(So It's not the best choice.
I can try to put a test inside the radeon driver because the PCI (X)BIOS return the endian format.

Regards,

Didier.

I'm trying to write a rather unusual type of ST emulator, and would need a little knowledge on the internals.

All I really need to find out is how to load a program into 68K space and run it, and how to convert ST GEM and TOS calls to native calls. The resulting emulator (I'm thinking of calling it CrySTal) is just going to be a way to run some Atari ST stuff on a PC which is already running GEM.

GEM on the PC does not support more than 640 MB of memory, does it?
Since a GEM application for the Atari can allocate large chunks of memory
without any tricks, the fact that it does not work this way with GEM/3
for the PC could be a showstopper.

If I use DJGPP I can work around the 640K limit. (This was my plan.) PC
GEM might not support it, but the compiler does, and the CPU core will be
running outside the 640K area anyway.

Alternatively, it may be possible to boot without the hard drive
switched on, then start it afterwards. You should have your HD
software disk in A:\ and run the installer again - or just the HD
driver, then put a new C:\ icon on the desktop. This /may/ allow
you to access the partition to remove LGD.

Note that ACCs do *not* belong in the AUTO folder, but the root
directory of C:\! Possibly that's causing the problem?

Regards, /Peter/

There are other problems I encountered when I wrote an application running on GEM/3 and on the Atari long ago, using the latest (i.e. last) release of GEM/3. The order of calls for certain functions (setting window attributes, for instance) should not matter, but under GEM/3 it actually does matter and changing the order sometimes led to crashes. Since I could change this order by changing my sources I could address this problem, but you cannot do that. So don't be surprised if something does not work even though an application does not do anything wrong.

In general my experience with GEM/3 was a bad one. It was instable, not always compliant to the specs, and if I had not had the stable Atari GEM to run tests on and to debug I would not have been able to get my application running on the PC.

I actually can probably do this, by manipulating the incoming GEM calls
before passing them on to GEM.

Hopefully FreeGEM (my actual target) is more stable than stock GEM/3. If
not, well, the source code is out there and I could probably try to fix
it.

PC GEM is lagging in features behind modern Atari GEM replacements
(Magic, Xaaes, Naes), and will be unable to run modern programs (lots of
them depend for example on NVDI). Moreover there may be some ABI
incompatibilities (not only endianess).

I think the better idea might be putting an effort into Aranym.

Hi Peter,

Tried recnnecting the HD once the ST had booted from drive A, could not add an icon to the desktop & HHDriver also could not see the partitions.

Hmmm, yes I remember now that the ACCs should go in auto folder, like you say this could be the problem. Am going to try connecting the HD to a Falcon and if I can mount the drives hopefully I can remove the offending items.

Dave.

Nowhere near as effective as it could have been. Posting something
inflammatory in one newsgroup and then setting the follow-up header
works much better, especially since a lot of people don't even notice
where their posts are being posted.

It's a pity that Google groups don't implement a filter to prevent open
proxies posting through their servers, since the source (148.244.150.52)
is listed in a few DNSBLs[0] as an open proxy, as this post would have
never been able to cause any disruption.

While irrelevant as far as .tar.gz files are concerned, and purely out
of curiosity, does it also handle .tar.bz2 files as well? Not that I've
ever seen them used for TOS/mint archives, there are quite a few in the
*nix world.

Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st,comp.sys.atari.st.tech

UPDATE:
I installed easyMiNT, actually I rushed an installation, but it went well.
At the first shot I had a working environment (with some glitches, 16
colours, 640x480, and my auto PRGs didn't load) but Papyrus loaded JPGs
immediately.

So, I assume, it is something connected with the TOS itself, or at least,
the TOS routines that are replaced by MiNT...
Now I'll dig into MiNT to see if it can accomodate my needs, so I'll forgot
plain TOS problems.

who knows...

In the meanwhile, thank you guys!

> Works great...

I'll give it a try, but would that solve my problem? It's still using
unzip.ttp (which I'm assuming is the same as the unzip.ttp included in
the unzip 5.1 archive? maybe not?)

Basically, both STZIP and Unzip cannot find any files in the archive at
all if I leave them as downloaded. STZIP shows an oddly truncated
folder filename, and maybe a file or two, but nothing exists in the
folder. Unzip simply says that the archive contains no files and quits.
If I change the filename to be 8+3 instead of long filename (i.e.
alpha.zip instead of alpha-04-september-2005.zip as is the case with
the latest XaAES snapshot), then Unzip will actually recognize that
there are files in the archive, but still won't be able to write them
to the disk (there is enough disk space, and any other file unzips fine
there). Not sure what the problem is, but it seems to happen most often
with Mint-related items, and people who specifically program using gcc
and other Mint-specific tools. Maybe it's something different between
the way Mint's ZIP compression works as opposed to other TOS/Magic
compatible versions? I don't know!

Thanks for your input!

For my ST the HD has to be switched on first, then the ST a few seconds later and once the Desktop appears you have to reset it so that it boots again so that is when it recognises the HD are you resetting the ST after you have reached the Desktop the first time?

Also if booting off C is causing probelms hold down the key representing a differect partition to boot from that one - might bypass the problem file in the C drive that way.

And most of the other emulators won't run these other AESes and VDIs, I don't think? As for ABI problems, there are two ways around those - patch the emulator or patch GEM, and theoretically, I can do either.

> I think the better idea might be putting an effort into Aranym.

Most current emulators seem to be heavier than they need to be. :/ It should, in my opinion, be possible to run basic ST stuff on a low-end Pentium.

Except maybe of NVDI modern AESes or VDIs are not designed t run on
plain ST, which most emulators emulate.

Try TosBox then. I was able to run modern FreeMiNT and Naes on it.

For basic ST stuff you basically do not need modern AES or VDI.

Yeah Mike that happens to me also. Here is what I do to get around it. First I unzip the whole file. I will get folders that have nothing in them. I then go into the folders in the ZIPPED file using Arcview and highlight their contents and another unzipp function and the files then appear. If anyone else has a better fix, I am all ears.

No I've not tried that, will give it a whirl... Nope, booted to the
desktop and reset, ST tries to boot from C and fails as before.

>Also if booting off C is causing probelms hold down the key

Superb! That's done it. I held down the D key and it's booted from
that drive. Never realised I could do that... doh.

Many thanks
Dave.

This is a hugely different animal! NVidia releases binary drivers for x86
and x86_64! Guess what you use if you're on PPC mac? Unaccelerated FB
drivers! That's not good at all. There's actually marginal open source
ATI drivers out there. For our platform, ATI is the choice.

>> I still say that the Voodoo cards would be the best choice considering

Those cards are ancient. Asking my voodoo 3 to do 1680x1050 which I need
for my LCD would not go well. If we're going to do it, we should do it
right. Even if ATI cards have less support, they have the support we need
to get things up and running. They're VERY fast too. The eclipse makes a
stock falcon twice as fast. Just ask Carey. 128kbit mp3 on a falcon uses
over 100% cpu time at times. Accelerate BUS and CPU, add an eclipse card,
and it uses somewhere around 30-40% (with DSP). It's important to let the
devs choose what they're most comfortable with, and I'd say ATI is it. We
want to get a product sometime this century.

Thanks,
Mark

>
> phantomm@bellsouth.net

To quote from my old friend Eric Hays:

"The latest version was dated April 18, 1991 (at least, that was the
latest
I ever got) and does indeed run fine on the Falcon, even in Falcon
resolutions, although I think it crashes in modes above 16 colors. "

I've often run WordPerfect on my stock Falcon under Geneva in 16 color mode. I tried it on my CT60, but it crashed. This may have to do with the fact that my CT60 was in 256 color mode at the time. In any event, I use WordPerfect very rarely nowadays, as Atariworks handles all my typing needs now that I'm no longer writing research papers.

Where are you saving to? It sounds as though your STING.INF file is
pointing to the wrong place.

O.O

You can play mp3 in realtime on a 68030? In the DOS world, I've never
heard of anyone playing mp3 on less than a 486/66.

Then again, '030 would clearly pound a 386 flat.

I can almost get a 128k mp3 to play on a 16Mhz Falcon. (There's too many pauses and stutters to say I've truly done it.) On accelerated Falcons it's quite easy.

Has anyone managed a 128k mp3 on a stock Falcon?

I'm looking for a flexible 17" Monitor (brand name and model so I can source locally) for a CT60 that can handle a broad range of resolutions and refresh rates etc. I'm using Centscreen 3 with 50 MHz bus. Any thoughts would be appreciated.

Thanks.

I can do it. If you have trouble, just set it in ST-High resolution.
It'll play no problem then. Tweak the aniplayer settings too. It's
designed to work on a stock falcon.

Thanks,
Mark

Okay, thats why I asked, to get some input/debate on the subject. I am now
"educated". <grin>

Nvidia also has a non-proprietary driver used with Mandriva out of the
box so its GPL legal. The catch? No solid 3D acceleration (some, but not
enough for top end games 'n stuff). You probably already knew that though.

They are ancient - I guess it was mentioned because there are such good
docs 'n stuff.

But...I agree with what you are saying Mark. Since we don't have unlimited
funding/numbers of developers, then its probably best to go with the
highest performance card that actually has a decent chance of being coded
for TOS/MINT.(and of course, as has been mentioned, whatever the actual
person doing the work is comfortable with).

Thanks for the input! :-)

Well, according to docs I read on the 'Net, they recommended the root of
your C drive. Which is what I did. I don't believe it was STING.INF that
the file selector asked for though, it was something like STING.PRG?

Thanks.

One problem with that... it's an RPM file -- no way to unpack it with Magic. And I just can't get a usable full Mint setup (even with EasyMint) in order to unpack it with that. If someone is willing to e-mail the binary to me in a form that is usable under Magic, then I'll definitely try it! Please use the address below my signature. Thanks for your suggestion, though!

Argh, let me correct that - I meant to say the file selector asked for
"STING.PRT", not "STING.PRG"...

I'm going to bed now. :-)

I would guess that this tuner has video signal output, if it is meant
to be used with a monitor and so would not have a TV RF output as such.

>card is set for swap bytes.

The Milan PCI bridge can be set for both big and little endian modes - for
CPU->PCI accesses, both are available to the software in separate address
spaces, so that a driver need not swap in most cases.

>The result is the sound that the milan
>blaster is in intel format :-(So It's not the best choice.

The problem is PCI->Memory DMA access: you have to cope with situations
where the byte-order is externally defined - for example a SCSI card with a
CD-ROM. If the SCSI card reads a sector from CD and writes the data to
memory, it uses 32-bit memory writes. Since the PCI bus is always little
endian, you have to setup the bridge so that the bytes end up in memory in
the right order - otherwise, the CPU would have to swap every sector
read/written, which is unacceptable performance-wise.

Unfortunetely, this also affects sound - you can only set one endian mode
for all cards together.

Asking your CT60 to push the data around to do 1680x1050 would not go
well either.

Coda.
